

# **Guidelines for Implementation: DASH-IF Interoperability Point for ATSC 3.0**

---

**January 31, 2016**

**DASH Industry Forum**

**Version 1.0**

# 1 Scope

---

2 The scope of this document is to provide a DASH interoperability point according to MPEG-DASH  
3 [2] that is based on DASH-IF IOPs [1] and provides extensions to address use cases and require-  
4 ments of ATSC 3.0 [3].

---

# 1 Disclaimer

---

2 This is a document made available by DASH-IF. The technology embodied in this document may  
3 involve the use of intellectual property rights, including patents and patent applications owned or  
4 controlled by any of the authors or developers of this document. No patent license, either implied  
5 or express, is granted to you by this document. DASH-IF has made no search or investigation for  
6 such rights and DASH-IF disclaims any duty to do so. The rights and obligations which apply to  
7 DASH-IF documents, as such rights and obligations are set forth and defined in the DASH-IF  
8 Bylaws and IPR Policy including, but not limited to, patent and other intellectual property license  
9 rights and obligations. A copy of the DASH-IF Bylaws and IPR Policy can be obtained at  
10 <http://dashif.org/>.

11 The material contained herein is provided on an "AS IS" basis and to the maximum extent permit-  
12 ted by applicable law, this material is provided AS IS, and the authors and developers of this  
13 material and DASH-IF hereby disclaim all other warranties and conditions, either express, implied  
14 or statutory, including, but not limited to, any (if any) implied warranties, duties or conditions of  
15 merchantability, of fitness for a particular purpose, of accuracy or completeness of responses, of  
16 workmanlike effort, and of lack of negligence.

17 In addition, this document may include references to documents and/or technologies controlled by  
18 third parties. Those third party documents and technologies may be subject to third party rules  
19 and licensing terms. No intellectual property license, either implied or express, to any third party  
20 material is granted to you by this document or DASH-IF. DASH-IF makes no any warranty what-  
21 soever for such third party material.

22 If you have comments on the document or identify and bugs or problems, please submit comments  
23 as follows:

- 24 • at the github repository <https://github.com/Dash-Industry-Forum/ATSC/issues>
- 25 • at the public repository <https://gitreports.com/issue/Dash-Industry-Forum/ATSC>

26 Note that technologies included in this document and for which no test and conformance materi-  
27 al is provided, are only published as a candidate technology, and may be removed if no test ma-  
28 terial is provided before releasing a new version of this guidelines document. The status of the test  
29 material can be verified on <http://testasests.dashif.org>.

# 1. Introduction

This document provides a DASH interoperability point that is based on DASH-IF IOPs and provides extensions to address use cases and requirements of ATSC 3.0.

The documents minimizes references to ATSC specifications; it is expected that ATSC will reference this document in order to enable a full ATSC 3.0 service.

The usage of this Interoperability Point is not restricted to ATSC3.0.

This specification defines the identifiers in

Table 1.

Table 1 Identifiers defined in this Document

Identifier	Semantics	Type	Section
<a href="http://dashif.org/guidelines/dash-atsc-main">http://dashif.org/guidelines/dash-atsc-main</a>	Main DASH Interoperability Point for ATSC	IOP	3.1
<a href="http://dashif.org/guidelines/dash-atsc-cgcompatibility">http://dashif.org/guidelines/dash-atsc-cgcompatibility</a>	Color gamut capability	Video	5.3.2.7
<a href="http://dashif.org/guidelines/dash-atsc-videoposition">http://dashif.org/guidelines/dash-atsc-videoposition</a>	View position for stereoscopic content	Video	5.3.2.7
<a href="http://dashif.org/guidelines/dash-atsc-scenedisparity">http://dashif.org/guidelines/dash-atsc-scenedisparity</a>	Scene disparity signaling	Video	5.3.2.7
<a href="http://dashif.org/guidelines/dash-atsc-temporalsub-layering">http://dashif.org/guidelines/dash-atsc-temporalsub-layering</a>	Temporal Sub-Layering	Video	5.3.2.7
<a href="http://dashif.org/guidelines/dash-atsc-staggercast">http://dashif.org/guidelines/dash-atsc-staggercast</a>	Staggercast signaling	Audio	5.4.3.5
<a href="http://dashif.org/guidelines/dash-atsc-program">http://dashif.org/guidelines/dash-atsc-program</a>	Program Signaling	Function	5.7.2
<a href="http://dashif.org/guidelines/dash-atsc-closedcaption">http://dashif.org/guidelines/dash-atsc-closedcaption</a>	Closed Caption	Subtitle	5.5.3.2
<a href="http://dashif.org/guidelines/dash-atsc-RRRating:1">http://dashif.org/guidelines/dash-atsc-RRRating:1</a>	Rating	Rating	5.7.3

## 2. Background and Assumptions (Informative)

### 2.1. Introduction

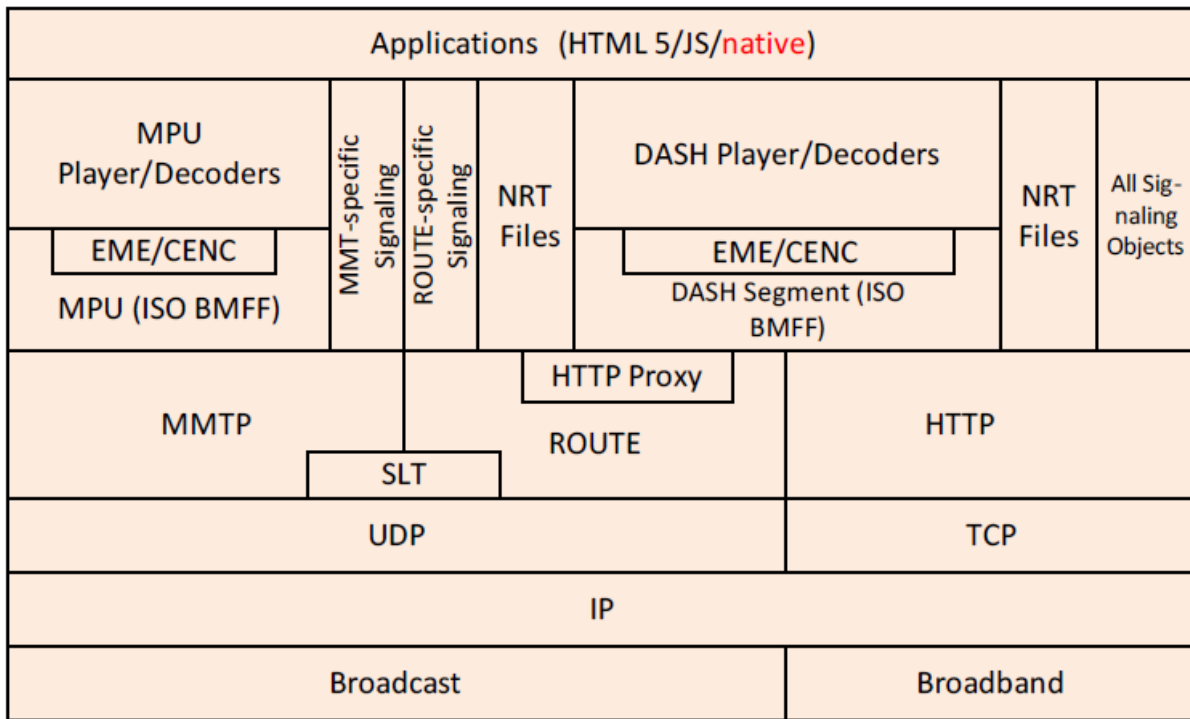

To set the context, this section provides background and assumptions, primarily shared by ATSC with DASH-IF. For a detailed overview on ATSC3.0, please refer to ATSC A/300 [3]. The ATSC A/300 standard [3] is the initial entry point to the ATSC 3.0 system. It provides both an overview

1 of the system and a guiding structure to the pertinent ATSC component standards that are to be  
 2 followed depending on how the system is configured, as indicated by the system signaling.

### 3 2.2. ATSC3.0 Protocol Stack

4 According to the ATSC A/331 [4] the protocol stack as presented in Figure 1 expresses the major  
 5 components of the ATSC delivery system. In particular, DASH formats play a central role as the  
 6 encapsulation and delivery format in the context of ATSC 3.0 for broadcast, broadband and hybrid  
 7 delivery.

8 In case of broadcast delivery, the interface between the underlying delivery system and the DASH  
 9 Player is at least conceptually based on an HTTP proxy that is included in the end point of the  
 10 delivery system. In addition to the interfaces to the transport system, the DASH Player as shown  
 11 in Figure 1 also provides the functionality to play media properly and to interface with native or  
 12 downloadable applications, typically in a browser-centric runtime environment.

13  
 14 Figure 1 ATSC Protocol Stack<sup>1</sup>

### 15 2.3. Client Reference Architecture

#### 16 2.3.1. Introduction

17 ATSC 3.0 as well as MPEG-DASH are defining emission standards. In addition, DASH formats  
 18 terminate (at least primarily) in the DASH Player and it is assumed that the DASH Player controls

---

<sup>1</sup> Reproduced with permission.

---

1 the streaming session by issuing HTTP requests scheduled at appropriate times to download Seg-  
2 ments from an HTTP server (possibly a distributed architecture using a CDN). In order to map  
3 DASH formats on top of ATSC delivery and create the appropriate service and user experience, it  
4 is considered useful to specify a reference architecture of an ATSC 3.0 receiver (or “client”) de-  
5 vice, referred to in this document as the Client Reference Model (CRM), in order to define and/or  
6 verify the proper emission specifications.

7 A decomposition of the functions and interfaces in the client enables the definition of proper emis-  
8 sion formats in order to verify that the distribution formats result in expected functionality to fulfill  
9 the ATSC 3.0 system requirements.

10 By no means would such a reference client imply a normative implementation, as it would only  
11 provide an example implementation to verify the adequacy of the delivery specification.

12 The CRM is expected to decompose the ATSC 3.0 receiver device into the relevant network inter-  
13 faces, device internal functions, interfaces to the application and interfaces to the media playout  
14 pipeline.

### 15 2.3.2. Overview: Functions and Interfaces

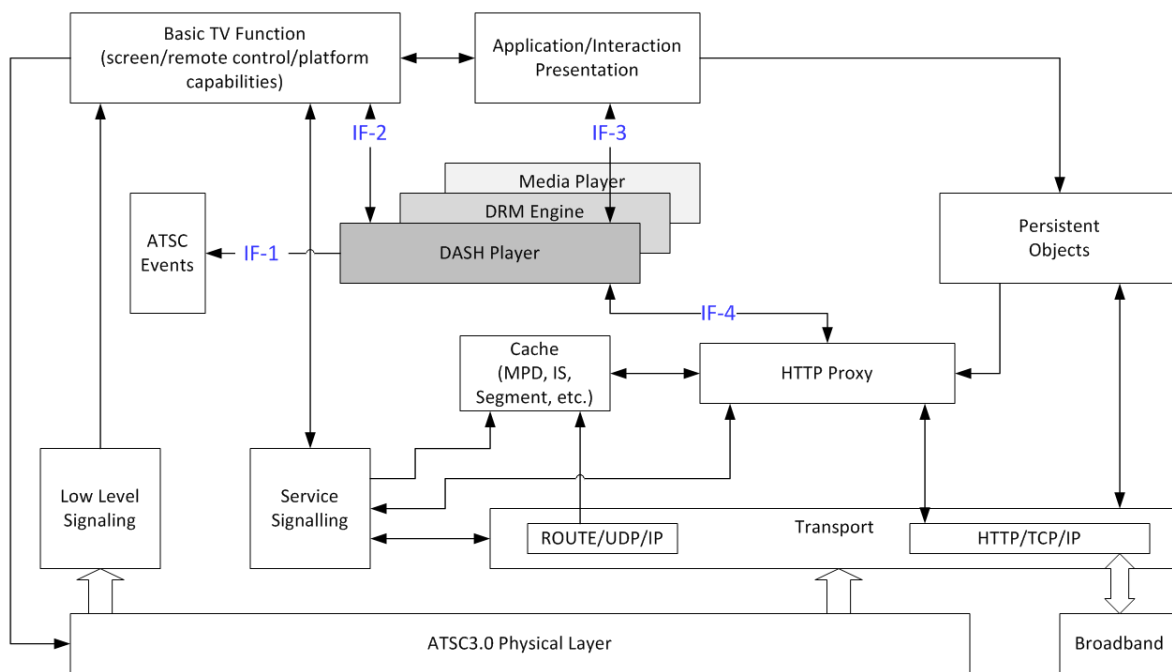

16 Figure 2 provides an overview of relevant functions and interfaces (IF) in the decomposition of  
17 the signaling and processing routines of the DASH Player. The DASH Player acts as a component  
18 in the ATSC 3.0 receiver client device.

19 The functions in the client are informative and do not imply a specific implementation. For exam-  
20 ple, Cache and HTTP Proxy may be implemented differently, but serve as a conceptual model and  
21 logical endpoint for service delivery.

22 The following functions are identified in the client reference model:

- 23 • ATSC 3.0 Physical Layer connections (possibly comprising multiple RF channels) and  
24 broadband connections provide the connectivity, via broadcast and broadband networks,  
25 to broadcasters/content providers to receive service signaling and data.
- 26 • ROUTE/UDP/IP and HTTP/TCP/IP that provide an object oriented transport protocol run-  
27 ning on top of IP in order to receive DASH resources as well as other objects and files that  
28 are relevant for the ATSC 3.0 service, or an application associated with the service.
- 29 • HTTP proxy: A local (i.e. device-resident) HTTP proxy that may be used to abstract the  
30 underlying physical and transport layer to a client application, in particular the DASH  
31 player, but may also be a broadcaster application. Application specific data, transient ser-  
32 vice objects and NRT content may be provided through the HTTP proxy.
- 33 • Low-Level Signaling: Signaling delivered over UDP/IP that provides channel scanning and  
34 basic service description and entry point information to enable service selection and acqui-  
35 sition by the Basic TV Function.
- 36 • Service Signaling: A function that picks up service-related signaling for the selected ser-  
37 vice which provides information to the receiver and DASH Player on IP-level service ac-  
38 quisition, as well as static and dynamic configuration of the service.
- 39 • Cache: Temporary storage and handling of the MPD, Initialization Segment and Media  
40 Segments whose reception are facilitated by service signaling.
- 41 • Basic TV Function: A platform that provides at the minimum rendering capabilities for  
42 A/V services as well as simple means for interactivity, typically via a remote control.

- 1 • Application/Interactive Presentation: A native or downloaded application that makes use  
2 of broadcast or broadband delivered data in order to provide a potentially richer and inter-  
3 active presentation to the end user.
- 4 • ATSC Events: A function that operates as a sink for ATSC events as defined in [5].
- 5 • DASH Player: A function that consumes MPDs and Segments, and communicates with  
6 other components in the CRM to which it interfaces to personalize the media experience  
7 based on platform capabilities, user preferences and user interaction. The DASH player  
8 also provides information to a DRM engine and media player in order to decrypt and de-  
9 code media.
- 10 • Persistent Objects: Persistent storage of typically non-real time objects. This function may  
11 provide the media resources for a DASH Media Presentations through the HTTP Proxy.

12  
13 Figure 2 Client Reference Model

### 14 2.3.3. Relevant Interfaces

15 The logical functions in the CRM exchange information via the defined interfaces as described in  
16 this section to support the processing and playout of media data. Although the documented inter-  
17 faces are conceptual, some of them may exchange information in a more formalized manner using  
18 well-defined APIs.

- 19 • IF-1: The ATSC specific events received by the DASH Player are dispatched to the ATSC  
20 event application through this interface.
- 21 • IF-2: If the service metadata includes an MPD, the MPD is handed to the DASH player  
22 and the DASH player is activated. In addition, the DASH player may exchange capability  
23 information with the Basic TV Function, for example on rendering and DRM capabilities,  
24 as well as on user preferences and settings.

- 
- 1 • IF-3: For an app-enhanced linear service, or an app-based service, the app and the DASH  
2 player may exchange over IF-3 information regarding capabilities, personalization, app-  
3 specific events, targeting, etc.
  - 4 • IF-4: A regular HTTP interface between the DASH player and the proxy. The interface  
5 follows HTTP methods, and may support extensions pertaining to error robustness and  
6 network information.

7 Other interfaces are conceptual and out of scope of this specification. More details on interfaces  
8 and the messages exchanged on the interface are provided in the remainder.

#### 9 2.3.4. Typical Bootstrap and Service Signaling

10 A typical bootstrapping sequence is presented in the following:

- 11 1. The Basic TV Platform requests a pre-configured Service List Table (SLT) in Low Level  
12 Signaling (LLS). SLT is delivered to the Basic TV Function, which then provides a user  
13 interface for ATSC 3.0 Service selection. User chooses a particular ATSC 3.0 Service for  
14 rendering.
- 15 2. By using the SLT, the user selects the service to consume, and the Basic TV Function  
16 uses the Service Layer Signaling (SLS) entry point information carried in the SLT for the  
17 selected service to provide access information to the ROUTE/UDP/IP stack to retrieve  
18 the SLS. SLS is delivered to the Basic TV Function, but certain elements are added as  
19 transient service objects to be available directly for the application, i.e. the DASH player.
- 20 3. By using the SLS, the Basic TV Function provides access information to the  
21 ROUTE/UDP/IP stack for downloading the DASH-formatted media components of the  
22 selected Service, which can be in turn sent to the HTTP proxy/cache to be temporarily  
23 stored. Assuming that the selected Service is a linear service that includes a targeted ad  
24 insertion broadcaster application, the receiver platform provides access information to the  
25 ROUTE/UDP/IP stack for downloading the broadcaster application. Ad files can be  
26 downloaded as NRT content and passed to and cached in persistent storage (as Persistent  
27 Objects).
- 28 4. The broadcaster application may be automatically launched upon reception, or launched  
29 under the control of the receiver platform.
- 30 5. Via IF-2, the DASH Player exchanges service capability information with the Basic TV  
31 Function, for example on rendering and DRM capabilities, as well as on user preferences  
32 and settings.
- 33 6. Upon the selection of a service, the Basic TV Function activates the DASH Player via IF-  
34 2, causing the DASH Player to request Media Segments from the HTTP proxy, via IF-4,  
35 at or after the Media Segment availability start times. Media Segments delivered via  
36 broadcast will be sent by the ROUTE/UDP/IP stack to the Cache, for subsequent for-  
37 warding to the HTTP Proxy. Media Segments delivered via broadband will be directly  
38 sent by the HTTP/TCP/IP stack to the HTTP Proxy.
- 39 7. DASH Player sends Segment request/receives Segments to/from the HTTP proxy/cache  
40 over IF-4. In an alternative implementation, the ROUTE receiver, i.e. the  
41 ROUTE/UDP/IP stack in the Transport block, may stream MDE(s) to the DASH Player  
42 as described in Annex A of A/331 [4]

- 1 8. Upon reception of Media Segments or MDE, the composite function comprising the
- 2 DASH Player, DRM Engine and Media Player decodes the received media content, and
- 3 the decoded media is returned to the Basic TV Function for screen display.
- 4 9. During Service reception there may be the occurrence of an ad avail. The DASH Player
- 5 will pass a remote Period element with XLink for resolution by the broadcaster applica-
- 6 tion. The broadcaster application may provide the DASH Player a replacement Period
- 7 which points to, for example, an Ad in the Persistent Objects store or other location.
- 8 10. After the ad avail, playout of the main program resumes based on repetition of steps 6-8.

## 9 2.4. Client and Service Types

### 10 2.4.1. Introduction

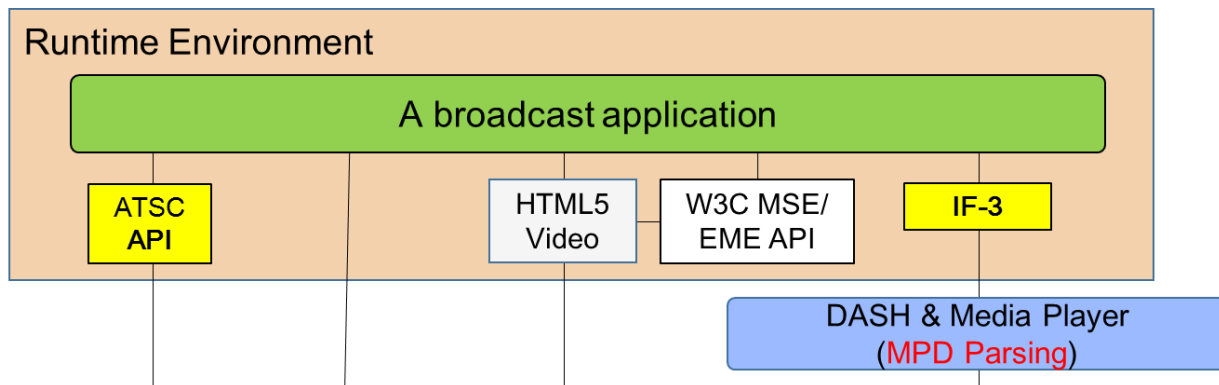

11 The service that includes a DASH Media Presentation may support different types and receiver  
 12 models, with different levels of involvement of the application or browser in the DASH media  
 13 consumption. Different service types are discussed in this sub-clause.

### 14 2.4.2. Client Type 1: Stand-alone

15 Client Type 1 is considered as a standalone without any interface to an app or browser, i.e. IF-3 in  
 16 Figure 2 is not present and the client obtains all information primarily from IF-2.

### 17 2.4.3. Client Type 2: App-based Enhancement

18 In client type 2 as shown in Figure 3, the DASH player still acts as a stand-alone player, but through  
 19 IF-3 in Figure 2 the DASH and media player may be partially controlled or at least some amount  
 20 of interaction applies. The initial presentation is still launched through the DASH Player.

21  
 22 Figure 3 App-based Enhancement

### 23 2.4.4. Client Type 3: DASH Player in Video Element

24 In this case the app launches a DASH player through a <video> element that is provided with a  
 25 URL to an MPD.

### 26 2.4.5. Client Type 4: App-based

27 In client type 4 as shown in Figure 4, the initial MPD is consumed in the app and all control is  
 28 done in the application. In order to enable such a deployment, the content needs to be offered  
 29 conforming to Media Source Extensions (MSE) [15].

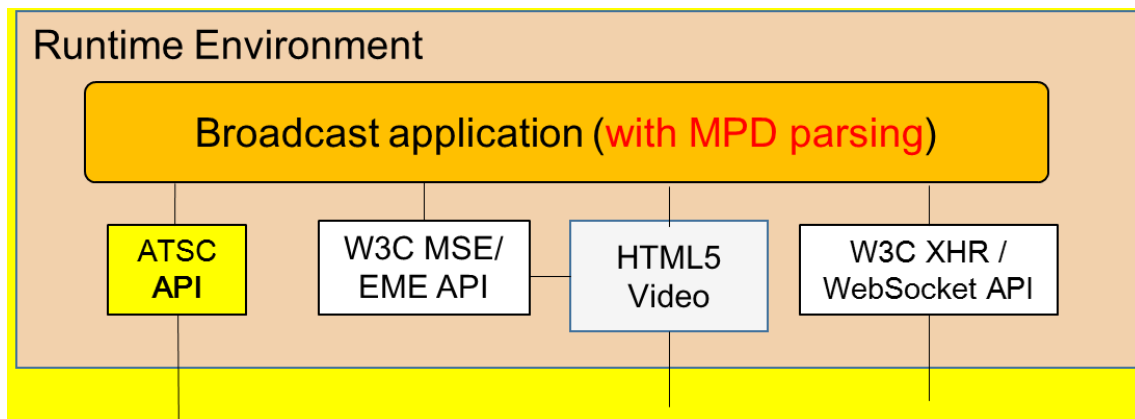

Figure 4 App-based Client

## 2.5. IF-1: Application Interface

The Application Interface enables communication of the DASH client with the application. An implementation of this interface is expected to be provided by a JSON RPC API defined in A/344 [11].

As an example, non ATSC-specific event streams may be supported. In addition, personalization information may be exchanged over this interface.

## 2.6. IF-2: Capabilities and User Settings/Interface

### 2.6.1. General

The MPD contains signaling on the property of the delivered media streams. These properties are also provided such that a Receiver can use this information to check if the stream matches platform capabilities. If the platform capabilities are not sufficient, the media stream is not considered for decoding and presentation. If the service contains more than one media stream of the same media type, then additional information needs to be provided to differentiate the media streams with the same media type and the DASH player typically needs to select one. In addition annotation can be provided that is used by the system to map against user preferences and presets (e.g. language or accessibility settings). Also signaling may be provided that supports the player in selecting a media stream when joining as well in the absence of other information. IF-2 is used by the DASH player to gather information from the platform on supported capabilities and user preferences and settings. Such a selection process needs to be done at join time and in case new content is spliced, i.e. DASH when a new Period is signaled.

The conceptual interface IF-2 expects that the DASH client can use the information in the MPD to query the platform for supported capabilities. The implementation of this interface is out of scope for this document. However, if for example an HTML-5 based user agent would be used to support track selection, parts of the interface may be implemented accordingly.

### 2.6.2. Video Specific Capabilities in context of ATSC 3.0

In the case of ATSC 3.0, typical differentiation of receiver capabilities for the video decoding and rendering pipeline may use one or multiple of the following properties:

- Codec capabilities

- 
- 1           ○ Single Layer Codec, Profile and Level
  - 2           ○ Scalable Codec
  - 3           ○ Temporal Sub-Layering
  - 4       • Display/rendering capabilities
  - 5           ○ spatial and temporal resolution
  - 6           ○ Scan Format, interlace or progressive
  - 7           ○ HDR capabilities
  - 8           ○ 3D capabilities
  - 9           ○ Color space capabilities

#### 10 2.6.3. Audio Specific Capabilities in context of ATSC 3.0

11 In the case of ATSC 3.0, typical differentiation of receiver capabilities for the audio decoding and  
12 rendering pipeline may use one or multiple of the following properties:

- 13       • Codec capabilities:
  - 14           ○ Codec, Profile and Level
- 15       • Rendering capabilities/environment
- 16       • User preferences and settings (accessibility, language, role)
- 17       • User interaction and Personalization

#### 18 2.6.4. Subtitle/Caption Specific Capabilities in context of ATSC 3.0

19 In the case of ATSC 3.0, typical differentiation of receiver capabilities for the subtitle and caption  
20 decoding and rendering pipeline may use one or multiple of the following properties:

- 21       • User preferences and settings (e.g., accessibility, language)
- 22       • Rendering capabilities (e.g., text profile, image profile)

#### 23 2.6.5. Transport Specific Capabilities in context of ATSC

24 In the case of ATSC 3.0, typical differentiation of receiver capabilities for the transport are:

- 25       • Broadcast-reception only
- 26       • Broadcast & Broadband
- 27       • Broadband only (no ATSC use case for broadband only, but media may primarily arrive  
28           through broadband, signaling always through broadcast)
- 29       • Maximum available broadband bandwidth
- 30       • Reception conditions, for example due to different robustness on the transport certain re-  
31           sources may or may not be available depending on the reception conditions.

#### 32 2.6.6. DRM Specific Capabilities in context of ATSC

33 In the case of ATSC 3.0, typical differentiation of receiver capabilities for the DRM are:

- 34       • available DRM systems

---

## 1 2.7. IF-3: Application Interfaces

### 2 2.7.1. Introduction

3 The runtime environment is a relevant concept in ATSC 3.0. This section looks into possible in-  
4 terfaces between the DASH Player and an application.

### 5 2.7.2. Parental Control

6 Content advisories, in ATSC, are metadata associated with Programs, and not with individual com-  
7 ponents in contrast to the Rating descriptor in DASH. Each Program in the broadcast schedule  
8 may be associated with a content advisory rating. In the ATSC system, content advisory ratings  
9 shall be signaled as described in Section 5.7.3. The DASH client may communicate with the  
10 platform to understand the content rating associated with platform and apply this on Program level.

### 11 2.7.3. Personalization and Ad Insertion

12 Personalized content may be distributed. If done, then the content is differentiated through a  
13 RESTful architecture, i.e. personalization is achieved using personalized HTTP URLs and other  
14 HTTP methods that enable targeted content. The logic on how to personalize requests is outside  
15 the DASH Player, but the DASH Player communicates through IF-3 with the application for per-  
16 sonalization information.

### 17 2.7.4. Media Control

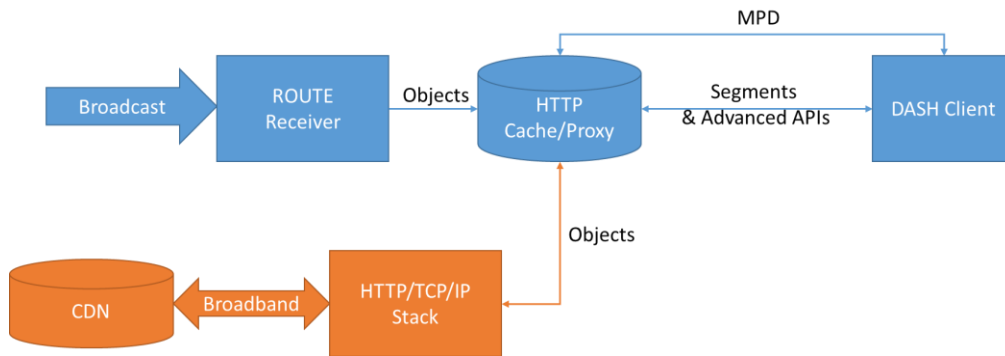

18 The application may control the media playout, potentially in a dynamic fashion. Examples for  
19 media control may include scaling and positioning the video, muting audio, trick modes such as  
20 pause and resume or other aspects. The DASH Player may get information on how the media is  
21 controlled and may use the information to optimize its processing, e.g. selection of Adaptation  
22 Sets and Representations. For example, if audio is muted, download of audio may be dispensed. If  
23 the video is consumed in a thumbnail version with no audio then only a low resolution video may  
24 be downloaded. Details on how such information is exchanged between the DASH Player and  
25 application are out of scope, but a DASH MPD is expected to provide information in order to react  
26 to such dynamic information from the application.

## 27 2.8. IF-4: Transport Interfaces

### 28 2.8.1. Introduction

29 Figure 5 provides an overview on the transport interfaces. A DASH Player can communicate with  
30 a local proxy and cache that has intelligence to receive content from broadcast through ROUTE  
31 and broadband through HTTP/TCP/IP.

32 Note: This description is only one possible implementation in order to show the use of a DASH Player in  
33 the ATSC 3.0 receiver model.

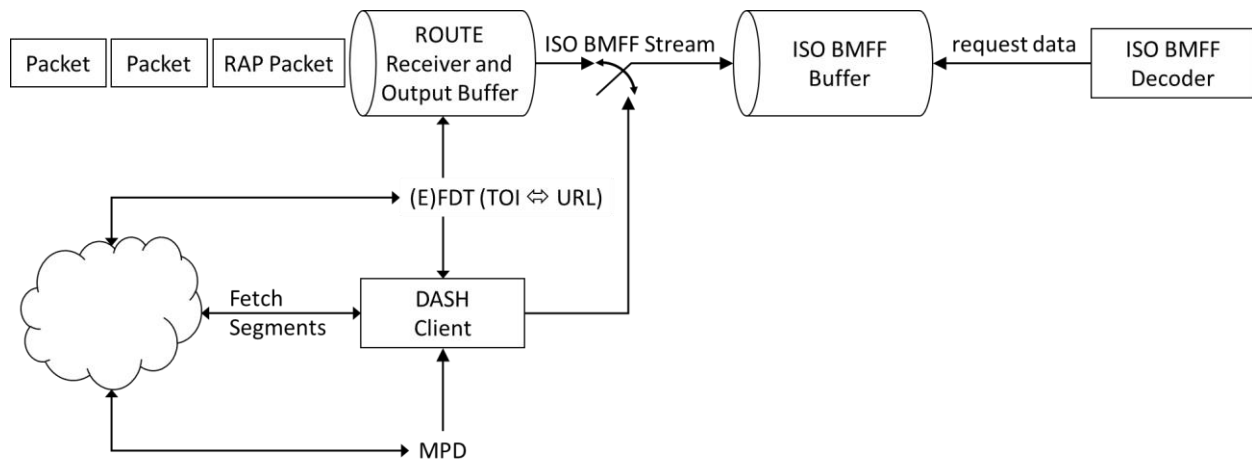

1  
2 Figure 5 Receiver model for Broadcast and Broadband Reception

3 2.8.2. MPD and Segment-based – Regular File Delivery

4 In the regular file or Media Segment delivery mode, the DASH Player makes a content request for  
5 an entire Segment as the delivery object from the HTTP Proxy over IF-4. It uses the MPD to  
6 construct the Segment URLs for the requests. The corresponding media stream(s) is(are) delivered  
7 via broadcast and/or broadband, and forwarded by the Transport block as shown in Figure 2 to the  
8 HTTP Proxy, as an example implementation method depicted in the diagram. In this implementa-  
9 tion method, the HTTP Proxy acts as a local HTTP server to return the requested Segments to the  
10 DASH Player over IF-4.

11 2.8.3. MDE-based for reduced startup delay

12 Figure 6 provides a possible implementation of the receiver in case the timing of the playout is  
13 controlled by the broadcast network and not the availability times in the MPD. DASH formats are  
14 distributed over broadband or broadcast. The MPD may be used as entry point or for example only  
15 when the broadband components are added. However, the timing of the broadcast/ROUTE distri-  
16 bution is determined by the broadcast transport and all relevant information may be provided  
17 through broadcast metadata. Startup may happen prior to reception of MPD and/or full segment.  
18 The MPD/DASH Player is still necessary for any hybrid aspects and to describe service details.

19  
20 Figure 6 Model for MDE-based receptions

---

1 MDE-based delivery may be implemented by a regular DASH client using HTTP requests prior  
2 to full reception of segments and the proxy/cache provides the data with HTTP Chunked Transfer.  
3 By this, a progressive media consumption is enabled. If HTTP Chunked Transfer is not supported,  
4 then other means may be used to enable early consumption of Media Segments, e.g. using the  
5 WebSocket API to directly feed the MSE source buffer. For more details refer to Annex A.

#### 6 2.8.4. Specific Methods for ATSC 3.0 beyond regular HTTP

##### 7 2.8.4.1. Status Codes

8 Guidelines for handling request responses according to case 4 from above are provided in MPEG-  
9 DASH, Annex A.7 [2].

##### 10 2.8.4.2. Robustness

11 Typical problems affecting robustness are documented in DASH-IF IOP, Annex B. The HTTP  
12 proxy and DASH Player may communicate using the tools defined in DASH-IF IOP, clause 4.8.

##### 13 2.8.4.3. Network redirection

14 Suitable methods for communication between the HTTP Proxy/Cache and the DASH Player are  
15 provided in TR 26.946 [13], clause 7.2.4.

16 Note: It is expected that updates will be provided once MPEG SAND [18] is fully defined  
17 and 3GPP has aligned as well.

##### 18 2.8.4.4. Partial File Handling

19 Suitable handling of partial files is defined in clause 7.9.2 of TS 26.346 [12].

20 Guidelines for handling request responses with 200 OK with the Content-Type set to applica-  
21 tion/3gpp-partial and 416 Requested Range Not Satisfiable are provided in Annex A.9 of TS  
22 26.247 [14].

## 23 2.9. Scope of this Specification

24 The scope of this specification is the definition of the DASH formats that conform to MPEG-  
25 DASH, but provide additional restrictions and extensions to fulfill the use cases and requirements  
26 documented by ATSC. The extensions include signaling for specific functionalities from ATSC  
27 including broadcast and hybrid services, specific media formats and codecs, subtitles, events,  
28 metadata, security and ad insertion functions.

29 In order to enable a complete end-to-end system, it is expected that receivers/DASH Players im-  
30 plement certain functions and processes, but this is outside of the scope of the specification. Nev-  
31 ertheless, expected receiver behavior is added in order to explain the assumptions when document-  
32 ing the signaling requirements. It is expected that this information may be used to define more  
33 detailed receiver requirements in the context of receiver specification for the ATSC 3.0 emission  
34 standard.

---

## 1 3. DASH MPD and Segment Constraints

### 2 3.1. Interoperability Points Signaling

3 The conformance to *DASH-IF ATSC Main* may be signaled by a @profiles attribute with the  
4 value <http://dashif.org/guidelines/dash-atsc-main>.

5 A Media Presentation (MPD and Segment formats) conform to the IOP by offering content fol-  
6 lowing the requirement and recommendations in the following sections:

- 7 • Clause 3.2: The requirements and recommendations from MPEG-DASH
- 8 • Clause 3.3: Requirements and recommendations related to DASH-IF IOPs
- 9 • Clause 4: Restrictions and Extensions on the Distribution Formats
- 10 • Clause 5: The Media Profiles and metadata as well as their mapping to DASH
- 11 • Clause 6 Ad Insertion requirements and recommendations
- 12 • Clause 7: DRM and Security Related requirements and recommendations

13 It is expected that with the combination of the ATSC specification and a usage of the DASH client  
14 following the CRM in clause 2.3, the ATSC use cases and requirements can be fulfilled.

### 15 3.2. Relation to MPEG-DASH

16 A *DASH-IF ATSC Main* Media Presentation shall conform to the ISO BMFF Broadcast TV Profile  
17 as defined in ISO/IEC 23009-1:2017, clause 8.11 [2].

18 Note: As this profile is not yet fully defined and published, the key principles are included  
19 in clause 4 and Annex B.

### 20 3.3. Relation to DASH-IF IOP

21 The Media Presentation is built on the features from DASH-IF IOP v3.3 [1]. However, the  
22 DASH+ATSC Media Presentation is not expected to be conforming to DASH-IF IOP taking into  
23 account that certain features and requirements for ATSC need to be enabled, that had not been  
24 included in the requirements for DASH-IF IOP.

25 A *DASH-IF ATSC* Media Presentation shall follow the requirements and recommendations from  
26 DASH-IF IOP of the following features and sections:

- 27 • The DASH formats in clause 3.2.1, including segment formats and only non-multiplexed  
28 Representations.
- 29 • The DASH timing model in clause 3.2.7
- 30 • The Recommendations on Bandwidth and Minimum Buffer Time in clause 3.2.8
- 31 • The Trick mode support in clause 3.2.9
- 32 • The Adaptation Set Constraints in clause 3.2.10
- 33 • The Segment-based Media Time Information in clause 3.2.11
- 34 • The Content Offering within a Period in clause 3.2.12
- 35 • The Switching across Adaptation Sets in clause 3.8
- 36 • The Simple Live Operation as defined in clause 4.9.2

37 Note that the main live operation as defined in clause 4.9.3 may be used as well.

---

## 1 4. Distribution Formats

### 2 4.1. Introduction

#### 3 4.1.1. Broadcast Distribution

4 In Broadcast Distribution, the broadcast channel is the only communication channel available to  
5 the DASH Player. Therefore, the DASH Player can only receive MPD and media segments  
6 through the broadcast channel. No return channel capability is available, but the client reference  
7 model as defined in clause 2 permits interfacing between the broadcast distribution and the DASH  
8 client.

9 Key aspects for linear TV services, in particular, broadcast services, are end-to-end latency and  
10 rapid channel change times. The distribution format should be easily integrated into ATSC deliv-  
11 ery protocols, in particular ROUTE/UDP/IP for broadcast according to the CRM as introduced in  
12 clause 2. The distribution format is expected to support synchronization of supplemental content,  
13 such as accessibility components, supplementary languages, etc. with primary A/V content; both  
14 the supplemental content and the primary content may be delivered via Broadcast.

#### 15 4.1.2. Hybrid Distribution

16 In addition to the broadcast channel, a broadband channel may also be available to the DASH Player.  
17 While AV services may be pure broadcast, or hybrid broadcast/broadband, service signaling al-  
18 ways starts on the broadcast channel. According to the ATSC A/331 specification [4], only a  
19 single MPD is used to signal content offerings on broadcast and broadband, the DASH Player may  
20 receive one MPD and Media Segments through the broadcast channel and/or the broadband chan-  
21 nel.

22 The broadband channel may for example be used to:

- 23 • send additional service information,
- 24 • send Media Segments as part of a pure broadband service (on-demand content, catch-up  
25 content, time-shift services, etc.),
- 26 • send Media Segments as part of additional service components to a broadcast service,
- 27 • send additional Media Segments as an enhancement to broadcast Media Segments (using  
28 scalable coding),
- 29 • send Media Segments as a temporary replacement to broadcast Media Segments (for error  
30 recovery purposes (retransmission) or fast channel change purposes).

31 The formats should be easily integrated into ATSC delivery protocols, in particular, HTTP/TCP  
32 and ROUTE/UDP/IP. The same service may be offered through broadcast and broadband (with  
33 different quality), seamless transition from broadcast to broadband and back to broadcast is ex-  
34 pected. The system is expected to support synchronization of supplemental content with primary  
35 content; both the supplemental content and the primary Content may be delivered via broadcast or  
36 broadband. The system is expected to provide the means for coping with variable content delivery  
37 latency.

---

## 1 4.2. Distribution Format

### 2 4.2.1. DASH Profile

3 This distribution format provides a restricted subset of MPEG-DASH primarily for distributing  
4 broadcast TV over broadcast and broadband services, including service offerings for combined  
5 broadcast and broadband services.

6 A *DASH-IF ATSC Main* Media Presentation shall conform to the ISO BMFF Broadcast TV Profile  
7 as defined in ISO/IEC 23009-1:2017, clause 8.11 [2].

8 Note: As the profile is not yet published, the profile is documented in Annex B.

9 In addition, the following constraints apply to the profile:

- 10 - The **MPD@type** shall be set to `dynamic`
- 11 - All Representations in one Adaptation Set shall have equal timescale values in all `@time-`  
12 `scale` attributes and `'tkhd'` `timescale` fields in Initialization Segments.
- 13 - The random access type as defined in ISO/IEC 23009-1:2017 clause 5.3.3.5, shall either  
14 be `"closed"` or `"open"`.

15 Note that “publishing a new MPD” for broadcast distribution is equivalent of sending an MPD  
16 such that the new MPD is available on the local cache in the device.

17 The MPD Base URL's for broadcast resources are identified by using a relative reference per  
18 RFC3986 [28], where the first character in the URI is a `"/`.

### 19 4.2.2. ROUTE protocol constraints

20 In order for the ROUTE receiver to properly identify DASH segments, the following options are  
21 possible:

- 22 - If `$Number$` based addressing is used, the TOI field of a given ROUTE packet should be  
23 set to the `$Number$` value of the DASH segment it contains and the File mode with EFDT  
24 templating should be used.
- 25 - If `$Time$` is used and no segment sequences, the length of `$Time$` value should not exceed  
26 32bits. The value of `'0'` and `'1'` shall not be used.
- 27 - If segment sequences are used with hierarchical addressing, then the entity mode ROUTE  
28 is expected to be applied in order to properly signal the Segments.

### 29 4.2.3. Segments, Random Access and Switching Points

30 Constraints on segmentation, random access and switching points follows the ISO BMFF Broad-  
31 cast TV Profile as defined in ISO/IEC 23009-1:2017, clause 8.11. More details on requirements  
32 for random access and switching points may be provided for each codec.

33 Note: More details will be added in the next revision of this document.

## 34 4.3. Basic Use Cases and Recommendations

### 35 4.3.1. Broadcast Distribution

36 For broadcast distribution, the following recommendations apply:

- 
- 1 - Only a single Representation per Adaptation Set should be present for broadcast distribu-  
2 tion.
  - 3 - the `@minimumUpdatePeriod` shall be set to 0. This permits to update the MPD with  
4 every new Segment.
  - 5 - The open ended Segment Timeline with `@r=-1` should be used.

#### 6 4.3.2. Hybrid Distribution

7 For hybrid distribution, the following recommendations apply:

- 8 - Representations that are expected to be seamlessly switchable (regardless whether they are  
9 distributed through broadcast or broadband) shall either be in the same Adaptation Set or  
10 the Representations shall be linked by using the Adaptation Set Switching signaling.
- 11 - If there are differences on the availability times between broadcast and broadband Repr-  
12 sentations, the `@availabilityTimeOffset` should be used.

### 13 4.4. Client Recommendations

14 The DASH client should check MPDs regularly for changes on the local cache, but should avoid  
15 parsing MPDs that have not changed.

16 Broadcast only clients are expected to support the simple live operation as defined in 4.9.2 of  
17 DASH-IF IOPs.

18 Hybrid clients are recommended to support the main live operation as defined in 4.9.3 of DASH-  
19 IF IOPs.

20 Access gain for applications to events carried in the event stream (which may be either signaled in  
21 the MPD, or carried in the Segments of a Representation) is relevant. Broadcaster-supplied appli-  
22 cations can register for events of interest using a JSON RPC API defined in A/344 [11]. The ap-  
23 plication identifies events of interest by specifying their `schemeIdUri` and (optionally) `value`.  
24 For each event associated with a registered event, the receiver's DASH Player is expected to pass  
25 the associated data to the application over interface IF-3. Both "static" Events, whose timing is  
26 known well in advance, as well as "dynamic" Events, the timing of which can only be determined  
27 in real time as the program unfolds, are expected to be supported by the receiver's DASH Player  
28 if the Runtime Application Environment specified in A/344 [11] is supported.

29 If an event is signaled as an inband event, the client is expected to parse each random access seg-  
30 ment at least up to the first 'moof' box. The DASH client parses the segment information and  
31 extract the earliest presentation time of the media segment.

32 If an 'emsg' is detected that is set to the value defined in the MPD, the DASH client is expected  
33 to parse the segment information and extract the following values:

- 34 • `emsg.ptd` the presentation time delta as documented in the `emsg`.
- 35 • `emsg.ed` the event duration as documented in the `emsg`
- 36 • `emsg.message_data`

37 After parsing, the Segment is typically forwarded to the media pipeline if it also used for rendering,  
38 but it may either be dumped (if the Representation is only used to access the DASH event, such as  
39 muted audio).

---

## 1 5. Mapping of ATSC Media to DASH

### 2 5.1. Introduction

3 The media profile focusses on mapping ATSC media, in particular video, audio and subtitles/CC  
4 to MPEG DASH. This includes issues for MPD signaling as well as Representation/File Format  
5 constraints.

6 In addition, this section provides also the signaling of other media related information, such as the  
7 content model or media-time related events.

### 8 5.2. Content Model and Metadata

#### 9 5.2.1. Introduction

10 The ATSC program or content played out by the user may be tracked for usage reporting. Content  
11 Identifiers are utilized for this tracking. Content identifier labeling is expected to be supported for  
12 broadcast and broadband content (including advertisements). As a minimum Content identifier  
13 values of type EIDR and Ad-ID, along with broadcaster-defined IDs (e.g., house numbers), are  
14 expected to be supported.

- 15 • “EIDR” indicates a content identification per the EIDR registry (<http://eidr.org>).
- 16 • “Ad-ID” indicates a content identifier per the Ad-ID registry (<http://ad-id.org>).

17 Extensibility should be provided for adding other content identifier types in future. Support for  
18 multiple content identifier values for the same content should be considered. Static (e.g. list of  
19 future scheduled content related content identifier values) and dynamic (e.g. unscheduled dynam-  
20 ically inserted advertisement related content identifier values) content identifiers signaling associ-  
21 ated with content should be considered.

22 Programs and associated Ratings are defined in clause 5.7.

#### 23 5.2.2. MPD Signaling

24 In order to annotate content, the DASH+ATSC Media Presentation author may use the Asset Iden-  
25 tifier descriptor on Period level as defined in ISO/IEC 23009-1, clause 5.8.4.10 .

26 Two schemes are defined here:

- 27 - the value of @schemeIdUri set to "urn:eidr" and then the value of @value attribute  
28 descriptor shall be a valid canonical EIDR entry as defined in [24].
- 29 - the value of @schemeIdUri set to the “Designator” for either the “full” or “compact”  
30 encoding as defined in SMPTE 2092-1 [25] and then the value of @value attribute de-  
31 scriptor shall be a valid Ad-ID entry as defined in [25].

32 Other schemes may be used, including user private schemes, by using appropriately unique values  
33 of @schemeIdUri.

---

## 1 5.3. Video

### 2 5.3.1. Background and Use Cases (Informative)

3 ATSC A/300 mandates that when HEVC video compression is used with ATSC 3.0, the ATSC  
4 A/341 standard [6] is followed. When HEVC is used, support is provided up to 3840 x 2160p at  
5 120 fps is HEVC Main 10 or Scalable Main 10 Profile, Level 5.2, Main Tier. The HEVC coded video  
6 includes legacy SD video and Interlaced HD video for support of existing content as well as Pro-  
7 gressive Video. The progressive video allows the full range of advanced features including high dy-  
8 namic range (HDR), wide color gamut (WCG), 3D, and temporal layering.

9 AFD and Bar Data are considered such that the active area of the picture does not necessarily need  
10 to fill the entire coded area.

11 When Spatial Scalable Coding is employed, both HD and UHD videos are encoded where HD  
12 video is coded in a base layer and UHD video is coded in enhancement and base layers.

13 When Temporal sub-Layering is applied, one video stream shall include two temporal video sub-  
14 streams. The video stream can be decoded with different frame rates according to the decoder's  
15 capabilities.

### 16 5.3.2. Service Offering Requirements and Recommendations

#### 17 5.3.2.1. Constraints on HEVC Adaptation Sets and Bitstreams

18 The HEVC Adaptation Sets and bitstreams shall conform to DASH-IF IOP, Section 6.2 [1].

19 Switching type shall either be set to media switching or to bitstream switching.

#### 20 5.3.2.2. MPD Signaling

##### 21 5.3.2.2.1. IOP Constraints

22 Elements and attributes are expected to be present for certain Adaptation Sets and Representations  
23 to enable suitable initial selection and switching.

24 All constraints of DASH-IF IOP, section 3.2.4 [1] on any Video Adaptation Set are applied except  
25 the constraint on @scanType.

26 For this IOP:

- 27 • For any Adaptation Set or for any Representation within an Adaptation Set with @con-  
28 tentType="video" the attribute @scanType need not be present, or if present, shall be set  
29 to "progressive" or "interlaced".

30 Note: default @scanType value is "progressive".

##### 31 5.3.2.3. DASH-specific aspects for H.265/HEVC video

32 For any Adaptation Set or for any Representation within an Adaptation Set with @con-  
33 tentType="video", all constraints of DASH-IF IOP, section 6.2.3 [1] are applied.

34 The ATSC 3.0 video profiles are defined in A/341 [6].

35 Additionally, DASH-IF IOP, table 16 [1] is extended with the following entries from Table 2.

36 Table 2 Codecs parameter according to ISO/IEC 14496-15 [10]

Profile	Level	Tier	Constraints	The @codecs parameter	The lhevcp1 parameter
---------	-------	------	-------------	-----------------------	-----------------------

HEVC Main 10	3.1	Main	progressive_source, non_packed, frame_only	hev1.2.4.L93.B0	n\a
			interlaced_source, non_packed	hev1.2.4.L93.60	n\a
	4.1	Main	progressive_source, non_packed, frame_only	hev1.2.4.L123.B0	n\a
			interlaced_source, non_packed	hev1.2.4.L123.60	n\a
	5.0	Main	progressive_source, non_packed, frame_only	hev1.2.4.L150.B0	n\a
	5.1	Main	progressive_source, non_packed, frame_only	hev1.2.4.L153.B0	n\a
5.2	Main	progressive_source, non_packed, frame_only	hev1.2.4.L156.B0	n\a	
HEVC Scalable Main 10	5.1	Main	progressive_source, non_packed, frame_only, non_temporal_layering	lhe1	0, 1.0.7.80.L153.BD.88
			progressive_source, non_packed, frame_only, non_temporal_layering	lhe1	0, 1.0.7.80.L156.BD.88
	5.2	Main	progressive_source, non_packed, frame_only, temporal_layering	lhe1	0, 1.0.7.80.L153.BD.88, 2.1.7.80.L156.BD.88

1

2

3

4

5

6

7

Note: The 'hev1', 'hev2' and 'lhe1' sample entry ensures convenient random access and switching without the need of searching and fetching parameter sets from earlier samples. The other sample entries ('hvc1', 'hvc2', and 'lhv1') do not guarantee such convenient random access and switching. Part 15 mandates parameter sets presence for 'hev1', 'hev2', and 'lhe1' types to randomly access at any IRAP picture and rely only on parameter sets from either the sample description (i.e., the IS) or from that sample onwards.

8

9

Note: The 'hev2' sample entry is only used for a representation exclusively containing the higher sub-layer of the base layer.

10

11

12

Note: When an HEVC Main 10 Profile or HEVC Scalable Main 10 Profile bitstream has a constant picture rate equal to 120, 120/1.001, or 100 pictures per second, temporal sub-layering with two temporal sub-layers may be applied.

13

14

15

16

When temporal sub-layering with two temporal sub-layers is applied, the bitstream shall contain exactly two sub-layers, with TemporalId equal to 0 and 1, respectively. Each sub-layer can be the output layer set.

17

18

Additionally, all relevant constraints to HEVC codec of DASH-IF-IOP, section 6.2.5 [1] are applied.

19

20

Note: The Codecs parameter signals the profile and level of the entire bitstream. For instance, when Temporal Layering is used, the Codecs parameter indicates the profile and level of the entire bitstream.

21

#### 5.3.2.4. ATSC Legacy SD

22

23

This section defines the DASH related constraints required for Legacy SD in DASH-IF IOP Section 6.2.1 [1].

24

Any Adaptation Set signaling Legacy SD shall contain only one Representation.

25

#### 5.3.2.5. ATSC Interlaced HD video

26

27

This section defines the DASH related constraints required for Interlaced HD in DASH-IF IOP Section 6.2.2 [1].

---

1 Any Adaptation Set signaling Interlaced HD shall contain only one Representation.

#### 2 5.3.2.6. ATSC progressive video

3 This section defines the DASH related constraints required for ATSC progressive video in DASH-  
4 IF IOP Section 6.2.3 [1].

5 If the content is encoded using HEVC Scalable Main 10 Profile, the base layer Representation of  
6 each enhancement layer Representation shall be identified using @dependencyId.

#### 7 5.3.2.7. Adaptation Sets constraints

8 All constraints of DASH-IF IOP, section 6.2.5 [1] on any Adaptation Set are applied except the  
9 following constraints:

- 10 • Only the active video area shall be encoded so that devices can frame the height and width  
11 of the encoded video to the size and shape of their currently selected display area without  
12 extraneous padding in the decoded video, such as “letterbox bars” or “pillar-box bars”.

13 The additional following constraints are applied to the Adaptation Sets:

- 14 • Color space of all representations within one Adaptation Set shall be the same. The color  
15 space shall be one of the followings: Rec. 709 [26] or Rec. 2020[27].
- 16 • If the color space of the content of an Adaptation Set is Rec. 2020, then an Essential or  
17 Supplemental Descriptor shall be present at that Adaptation Set element, with @schemeI-  
18 dUri of urn:mpeg:mpegB:cicp:colourprimaries URI and @value of “9” [17].
- 19 • If the color space of the content of an Adaptation Set is compatible with Rec. 709, then an  
20 Essential or Supplemental Descriptor shall be present at the Adaptation Set element, with  
21 @schemeIdUri of http://dashif.org/guidelines/dash-atsc-cgcompatibility  
22 URI and @value of “1”.
- 23 • For stereoscopic video content, the view position shall be signaled using an Essential or a  
24 Supplemental Descriptor at the Adaptation Set element of the “left” video, with  
25 @schemeIdUri of http://dashif.org/guidelines/dash-atsc-videoposition URI  
26 and @value equal to the value of @id of the “right” Adaptation Set. The scene disparity  
27 range shall be signaled using a Supplemental Descriptor at the Adaptation Set element of  
28 either left or right video, with @schemeIdUri of http://dashif.org/guide-  
29 lines/dash-atsc-scenedisparity URI and @value of comma separated of two pa-  
30 rameters. The first parameter represents the minimum disparity, and shall be an integer  
31 between -1024 and 1023. The second parameter represents the maximum disparity and  
32 shall be an integer between 0 and 2047.
- 33 • When Temporal Sub-Layering with constraints defined in section 6.3.4 of A/341 [7] is  
34 used in a Representation, then a Supplemental Descriptor shall be present at that Repre-  
35 sentation, with @schemeIdUri of http://dashif.org/guidelines/dash-atsc-tem-  
36 poralsub-layering URI. The value of the @value attribute shall consist of two parts  
37 separated by a delimiter ‘,’ with second part optionally present:
  - 38 — The first part will be an 8-bit unsigned integer with value equal to the Level for tem-  
39 poral sub-layer zero of the Representation. This will be equal to the value of syntax  
40 element sub\_layer\_level\_idc[ 0 ] of the Representation.
  - 41 — The second part if present will be coded as a string using process defined for Codecs  
42 MIME type specification in Annex E section E.3 of ISO/ IEC 14496-15 for single

---

1 layer HEVC with syntax element `sub_layer_profile_space[ 0 ]`,  
2 `sub_layer_tier_flag[ 0 ]`, `sub_layer_profile_idc[ 0 ]`,  
3 `sub_layer_profile_compatibility_flag[ 0 ][ j ]` for `j` in the range  
4 of 0 to 31, inclusive, and each of 6 bytes of the constraint flags starting from  
5 `sub_layer_progressive_source_flag[ 0 ]` respectively substituted for  
6 element `general_profile_space`, `general_tier_flag`, `gen-`  
7 `eral_profile_idc`, `general_profile_compatibility_flag[ j ]`  
8 for `j` in the range of 0 to 31, inclusive, and each of 6 bytes of the constraint flags  
9 starting from `general_progressive_source_flag`. If the second part is ab-  
10 sent then all other `profile_tier_level()` parameters for the temporal sub-  
11 layer zero besides the `sub_layer_level_idc[ 0 ]` parameter which is sig-  
12 nalled in the first part shall be inferred to be same as the value of those parameters  
13 signalled in Codecs parameter for the Representation. If all Representations of an Ad-  
14 aptation Set contain Temporal Sub-Layering with constraints defined in section 6.3.4  
15 of A/341 [6] and all Representations have the same profile, tier, level and flags infor-  
16 mation for temporal sub-layer zero, then the above descriptor may be used at the Ad-  
17 aptation Set element.

- 18 • When temporal sub-layering with two temporal sub-layers is used in two Representations,  
19 each temporal sub-layer is carried in a Representation respectively, `@codecs` values shall  
20 be present at the Representation to signal the profile/level/tier described in Sample De-  
21 scription of the track contained in each Representation (see 5.3.2.8 for details). When the  
22 first containing VCL NAL units with `TemporalId` greater than 0 only and the second  
23 containing VCL NAL units with `TemporalId` equal to 0 only, the first Representation  
24 shall be associated to the second Representation by using `@dependencyId` attribute in  
25 the MPD.

#### 26 5.3.2.8. Segment Format and Encapsulation Requirements for H.265/HEVC video

27 The encapsulation of HEVC single-layer bitstream in a file shall be according to Clause 8 and  
28 Clause 9 of ISO/IEC 14496-15 [16] with the following constraints applied:

- 29 • Each track shall carry only one layer or a subset of one layer, and the HEVC bitstream  
30 shall be carried in at most two tracks.
- 31 • Each track shall be encapsulated in one DASH Representation.
- 32 • Extractors and aggregators shall not be included in any track.
- 33 • If a track carries a subset containing VCL NAL unit with `TemporalId` greater than 0  
34 only, the sample entry type shall be `'hev2'`. Otherwise, the sample entry type shall be  
35 `'hev1'` as defined in [16].
- 36 • When temporal sub-layering is applied and all samples (for both `TemporalId=0` and 1)  
37 are carried in a single track, the track shall contain sample group description box contain-  
38 ing sample group entry type `'tscl'` and corresponding sample-to-group box which as-  
39 signs a sample group for each sample within that track.
- 40 • When temporal sub-layering is used and sub-layers are carried in separate tracks, the fol-  
41 lowing requirements apply.

- 
- 1 — The ‘hev1’ sample entry of the track (carrying VCL NAL unit with `TemporalId`  
2 equal to 0 only) shall indicate the level of the substream, i.e. the value of  
3 `sub_layer_level_idc[ 0 ]` in the SPS if the value of  
4 `sub_layer_level_present_flag[ 0 ]` equal to 1.
- 5 — The ‘hev2’ sample entry of the track (carrying VCL NAL unit with `TemporalId`  
6 greater than 0 only) shall indicate the level of entire stream (including both temporal  
7 sub-layers).
- 8 — In the track with sample entry type of ‘hev2’, the decoding time of each sample con-  
9 taining VCL NAL units shall be equal as in the case when both temporal sub-layers  
10 are stored in a single track.

- 11 • The encapsulation rules for HEVC as defined in DASH-IF IOP v3.3 [1] apply.

12 The encapsulation of an SHVC bitstream in a file shall be according to Clause 9 of ISO/IEC 14496-  
13 15 [16] with the following constraints applied:

- 14 • Each track shall carry only one layer or a subset of one layer, and the SHVC bitstream  
15 shall be carried in at most two tracks.

16 Note: With this constraint in place, a sample entry cannot contain both the HEVC and L-HEVC configura-  
17 tions, and the two layers of an SHVC bitstream have to be carried in two tracks, one for each layer.

- 18 • Each track shall be encapsulated in one DASH Representation.
- 19 • Extractors and aggregators shall not be included in any track.
- 20 • The base track (i.e., the track containing the base layer) shall use the sample entry type  
21 ‘hev1’ as defined in [16].
- 22 • For each track that carries a layer for which the VCL NAL unit has `nuh_layer_id` greater  
23 than 0 or a subset of such a layer, the sample entry type shall be ‘lhe1’.
- 24 • The external base layer sample group shall not be included in any track.
- 25 • When temporal sub-layering is applied and all samples (for both `TemporalId=0` and 1)  
26 of a layer are carried in a single track, the track shall contain sample group description  
27 box containing sample group entry type ‘tscl’ and corresponding sample-to-group box  
28 which assigns a sample group for each sample within that track.

29 No additional constraint on Segments other than imposed by the DASH profile is specified.

30 Note: Switching from the base layer (BL) to the enhancement layer (EL) can only occur at a segment or  
31 subsegment of the EL Representation starting with a sample containing an IRAP picture at the EL. Switch-  
32 ing from the EL to the BL can occur at the start of any segment or subsegment of the BL Representation,  
33 regardless of whether that segment or subsegment starts with a sample containing an IRAP picture at the  
34 EL.

### 35 5.3.2.9. Multiple Frame Rate Temporal Filtering Information Signaling

36 The Multiple Frame Rate Temporal Filtering allows efficient delivery of video with independent  
37 effective shutter intervals. When the Multiple Frame Rate Temporal Filtering described in A/341  
38 Section 6.3.4.1 and Annex D [6] is used the constraints described in section A/341 6.3.4 regarding  
39 High Frame Rate Temporal Sub-Layering also apply. When Multiple Frame Rate Temporal Filter-  
40 ing as described in A/341 Section 6.3.4.1 [6] is used in a Representation, then a Essential Descriptor  
41 shall be present at that Representation, with `@schemeIdUri` set equal to  
42 <http://dashif.org/guidelines/dash-atsc-multiframe-rate-temporal->

1 filtering. The value of the @value attribute shall indicate a parameter which indicates a 2 bit  
 2 field expressed as a 2 character string representing 2 binary bits which shall indicate the values of  
 3 temporal filtering parameters temporal\_filter\_w1 and temporal\_filter\_w2. The  
 4 temporal\_filter\_w1 and temporal\_filter\_w2 parameters are used in the recovery  
 5 process as described in the Annex D, section D.1.1 in A/341 [6]. In this case temporal\_fil-  
 6 ter\_w1 parameter shall indicate the weight of the temporally preceding temporal sub-layer 1 pic-  
 7 ture that contributes to the current temporal sub-layer 0 picture and temporal\_filter\_w2 parameter  
 8 shall indicate the weight of the high frame rate picture (not provided in the raw stream) in the  
 9 current temporal position that contributes to the current temporal sub-layer 0 picture. The values of  
 10 **temporal\_filter\_w1** and temporal\_filter\_w2 are inferred based on the signaled  
 11 @value as shown in Table 3. The value of temporal\_filter\_w1 plus temporal\_fil-  
 12 ter\_w2 shall equal 1.

13 Note that this technology is expected to require specific APIs from the DASH client to the media  
 14 decoder implementation and video display pipeline and may therefore not be usable to systems  
 15 where the such APIs are not available.

16 Table 3 Values of Multiple Frame Rate Temporal Filtering parameters

@value parameter	temporal_filter_w2	temporal_filter_w1
'00'	4/5	1/5
'01'	2/3	1/3
'10'	4/7	3/7
'11'	1/2	1/2

17  
 18 A receiver capable of High Frame Rate playback but not capable of recovery process as described  
 19 in A/341 Section 6.3.4.1 [6] should select a Representation (if available) without a Essential De-  
 20 scriptor with @schemeIdUri set equal to [http://dashif.org/guidelines/dash-](http://dashif.org/guidelines/dash-at-sc-multiframe-rate-temporal-filtering)  
 21 [at-sc-multiframe-rate-temporal-filtering](http://dashif.org/guidelines/dash-at-sc-multiframe-rate-temporal-filtering).

22 If all Representations of an Adaptation Set use Multi-Frame Rate Temporal Filtering with same  
 23 temporal filter weights then the above descriptor may be used at the Adaptation Set element.

24 Regarding switching, the following is supported:

- 25 a) A receiver capable of only Standard Frame Rate playback as defined in A/341 Section  
 26 6.3.4.1 [6] may switch between a Standard Frame Rate Representation and a Representation  
 27 utilizing High Frame Rate Temporal Sub-Layering as defined in A/341 Section 6.3.4 [6]  
 28 with Multiple Frame Rate Temporal Filtering as defined in A/341 Section 6.3.4.1 [6]. If  
 29 multiple Representations with Multiple Frame Rate Temporal Filtering with different  
 30 weighting factors are available, the one with the highest available value for tem-  
 31 poral\_filter\_w1 minimizes temporal aliasing (strobing) and may be preferred.
- 32 b) A receiver capable of only Standard Frame Rate playback as defined in A/341 Section  
 33 6.3.4.1 [6] may switch between a Standard Frame Rate Representation and a Representation  
 34 utilizing High Frame Rate Temporal Sub-Layering as defined in A/341 Section 6.3.4 [6] but  
 35 not utilizing Multiple Frame Rate Temporal Filtering.

- 
- 1 c) A receiver capable of High Frame Rate playback as defined in A/341 Section 6.3.4.1 [6]  
2 may switch between any Representations utilizing High Frame Rate Temporal Sub-Layer-  
3 ing as defined in A/341 Section 6.3.4 [6] with or without Multiple Frame Rate Temporal  
4 Filtering as defined in A/341 Section 6.3.4.1 [6].
- 5 d) A receiver capable of High Frame Rate playback as defined in A/341 Section 6.3.4.1 [6]  
6 may switch between a Standard Frame Rate Representation and a Representation utilizing  
7 High Frame Rate Temporal Sub-Layering as defined in A/341 Section 6.3.4 [6] with or  
8 without Multiple Frame Rate Temporal Filtering as defined in A/341 Section 6.3.4.1 [6].

## 9 5.4. Audio

### 10 5.4.1. Background and Basic Use Cases (Informative)

11 The use cases provided by ATSC to DASH-IF are expected to be supported by the client reference  
12 model. The client can select audio components based on e.g.:

- 13 • the audio language preference setting of the receiver
- 14 • the accessibility settings of the receiver
- 15 • the codec capabilities of the receiver
- 16 • the output preference of the receiver (e.g. stereo vs. multichannel output)
- 17 • new parameters or methods for signaling of next generation audio defined by DASH-IF  
18 in order to signal immersive and personalized content
- 19 • the network connectivity, if applicable (access to hybrid content via Ethernet or WiFi).  
20 This may for example include that certain languages are only available if the receiver  
21 provides broadband connectivity.
- 22 • the usage of impairment techniques which rely on additional audio streams

23 Audio that consists of multiple components that contribute to an experience is expected to be sup-  
24 ported. Personalization based on multi-component audio is expected to be supported. Multi-com-  
25 ponent audio is able to coexist with single-component audio. Signaling is defined to be agnostic  
26 to the underlying format of the audio stream. Signaling of availability of audio tracks to provide  
27 for user selection is expected. Signaling of Next Generation Audio (NGA) on systems level as well  
28 as evaluation of related content signaling by the decoder is expected to be enabled in order to  
29 address requirements of different client architectures. NGA codecs introduce the concept of Pre-  
30 selections which cannot be described sufficiently by today's collection of DASH parameters. The  
31 audio and DASH signaling experts extended parameters as required to enable NGA Preselections.  
32 ATSC 3.0 also expects the availability of signaling for accessibility services. The signaling is also  
33 expected to enable utilization of NGA codec features i.e. coding of audio elements. The signaling  
34 should enable delivery of audio elements for impairment services via broadcast as well as via  
35 broadband.

### 36 5.4.2. Assumptions and Definitions

#### 37 5.4.2.1. Introduction

38 The Preselection element as defined in ISO/IEC23009-1:2014/Amd.4:2016 [2] is used for audio  
39 signaling in the context of ATSC 3.0. It is specifically adapted to address the next generation audio  
40 concepts. For common concepts of ATSC 3.0 audio, see A/342-1 [7].

1 Note: As ISO/IEC23009-1:2014/Amd.4:2016 [2] is not yet published, the relevant con-  
2 cepts are provided in Annex C.

3 5.4.2.2. Bundle

4 In the context of ATSC 3.0 audio, a Bundle is a closed set of audio elements that can contribute to  
5 the playout of one NGA audio decoder. Examples for audio elements are an English dialogue,  
6 German dialogue, or Music & Effects. The referred audio elements can be carried in one or sepa-  
7 rate tracks or in one or separate Adaptation Sets. Typically, not all audio elements of one bundle  
8 are played out at the same time. The set of audio elements of one audio Bundle can provide mul-  
9 tiple personalization options like different languages, flexible gain or spatial location of audio el-  
10 ements, typically exposed through a user interface. A Bundle typically contains several Preselec-  
11 tions.

12 5.4.2.3. Preselection

13 A Preselection is a personalization option to produce a complete audio experience. It is associated  
14 with one or more audio elements from one Bundle plus additional parameters like gain or spatial  
15 location. A Preselection can be considered the NGA equivalent of alternative audio tracks contain-  
16 ing complete mixes using traditional audio codecs. Multiple Preselection instances can refer to the  
17 same set of elements in a Bundle for example with different settings for gain and spatial location.  
18 Only audio elements of the same Bundle can contribute to the decoding and rendering of a Prese-  
19 lection.

20 The Preselection concept is common to both NGA codecs referenced by ATSC 3.0 and is mapped  
21 to the systems layer to provide a basic selection mechanism, e.g. for user preferred languages,  
22 accessibility, etc.

23 5.4.2.4. Compound Stream

24 One audio elementary stream comprising more than one audio element.

25 5.4.2.5. Full-Compound Stream

26 One audio elementary stream comprising all audio elements belonging to one audio Bundle.

27 5.4.3. Codec-Independent Mapping to DASH

28 5.4.3.1. Additional Attributes

29 The following attributes are available in Adaptation Sets and Media Content Components for  
30 ATSC 3.0 as given in ISO/IEC23009-1:2014/Amd.4:2016 [2].

31 Table 4 MPD Adaptation Set

Element or Attribute Name	Use	Description
Adaptation Set		
@tag	O	Tag to be used to identify this adaptation set towards an external scope (e.g. decoder)

32

1

Table 5 MPD Media Content Component

Element or Attribute Name	Use	Description
<b>Media Content Component</b>		
@tag	O	Tag to be used to identify this content component towards an external scope (e.g. decoder)

## 2 5.4.3.2. Preselection

3 A Preselection is a personalization option to produce a complete audio experience as defined above  
4 in clause 5.4.2.3. By using a Preselection as a starting point, the client can avoid unnecessary  
5 consumption of network resources by selecting only those Adaptation Sets necessary for a specific  
6 Preselection and only downloading one Representation of each selected Adaptation Set.

7 Two different methods are defined how to signal Preselections in the MPD: The Preselection De-  
8 scriptor and the Preselection Element.

9 The Preselection descriptor is defined in 5.3.11.2 of ISO/IEC23009-1:2014/Amd.4:2016 [2]. It  
10 enables simple setups and backward compatibility, but may not be suitable for advanced use cases.  
11 The usage of the Preselection descriptor in ATSC 3.0 is provided in clause 5.4.3.4.

12 The Preselection element is defined in 5.3.11.3 and 5.3.11.4 of ISO/IEC23009-  
13 1:2014/Amd.4:2016 [2]. More refinements for NGA in ATSC 3.0 on Preselection Elements are  
14 defined in clause 5.4.3.3.

## 15 5.4.3.3. Preselection Element

16 The concept of Preselection Elements is orthogonal to the concept of Adaptation Sets. The Prese-  
17 lection element is provided on Period level.

18 A subset and constrained usage of the Preselection element is shown in Table 6. Note that the “Use”  
19 column may be different from what is defined in ISO/IEC23009-1:2014/Amd.4:2016 [2] and pro-  
20 vide specific constraints when using the Preselection element for NGA in ATSC 3.0. Other ele-  
21 ments and attributes than provided in Table 6 should only be present if needed for backward-  
22 compatibility and may be ignored by the DASH client. The detailed semantics can be found in  
23 ISO/IEC23009-1:2014/Amd.4:2016 [2].

24

Table 6 MPD Preselection for NGA in ATSC

Element or Attribute Name	Use	Description
<b>Preselection</b>		
@id	OD De- fault=1	See ISO/IEC23009-1:2014/Amd.4:2016 [2].
@audioSamplingRate	O	See ISO/IEC23009-1:2014/Amd.4:2016 [2].
@codecs	M	See ISO/IEC23009-1:2014/Amd.4:2016 [2].
@selectionPriority	OD	See ISO/IEC23009-1:2014/Amd.4:2016 [2].

Element or Attribute Name	Use	Description
	default=1	
@preselectionComponents	M	See ISO/IEC23009-1:2014/Amd.4:2016 [2].
@tag	M	See ISO/IEC23009-1:2014/Amd.4:2016 [2]. Note that the tag is mandatory ATSC Audio and provides a unique binding of the Preselection to the decoder.
<b>Language</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2].  Note that the @lang attribute should not be present. If present, at least one <b>Language</b> element shall be present that expresses the language of @lang redundantly.
<b>Role</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2]. The usage should be restricted to the Role scheme defined in ISO/IEC 23009-1 [2] and the following values: main, alternate, supplementary, commentary, dub, and emergency.
<b>Accessibility</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2]. The usage should be restricted to the Role scheme defined in ISO/IEC 23009-1 [2] and the following values: descriptions, enhanced-audio-intelligibility.
<b>Viewpoint</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2]. The viewpoint descriptor may be used to annotate Adaptation Sets from different media types that are preferably played jointly, e.g. and audio and video presenting the view from the same viewpoint.
<b>Rating</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2]. For usage, please refer to clause 5.7.3.
<b>Label</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2].
<b>AudioChannelConfiguration</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2].
<b>EssentialProperty</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2].  The following schemes and values are expected to be recognized by a receiver: <ul style="list-style-type: none"> <li>- Content Interactivity descriptor as defined in ISO/IEC23009-1:2014/Amd.4:2016 [2], clause 5.8.5.11 with value set to 1.</li> <li>- Others defined by the codec specifically</li> </ul>
<b>SupplementalProperty</b>	0 ... N	See ISO/IEC23009-1:2014/Amd.4:2016 [2].

Element or Attribute Name	Use	Description
<b>Legend:</b> For attributes: M=Mandatory, O=Optional, OD=Optional with Default Value, CM=Conditionally Mandatory. For elements: <minOccurs>..<maxOccurs> (N=unbounded) Elements are <b>b01d</b> ; attributes are non-bold and preceded with an @.		

#### 1 5.4.3.4. Preselection Descriptor

2 A scheme is defined to be used with an Essential or Supplemental Descriptor as  
3 "urn:mpeg:dash:preselection:2016". The value of the Descriptor provides two fields, sepa-  
4 rated by a comma:

- 5 • the tag of the Preselection
- 6 • the id of the contained elements/content components of this Preselection list as white space  
7 separated list in processing order. The first id defines the main element.

8 If the Adaptation Set includes the main element, then the Supplemental descriptor may be used to  
9 describe contained Preselections in the Adaptation Set.

10 If the Adaptation Set does not contain the main element the Essential Descriptor may be used  
11 instead.

12 The bundle is inherently defined by all elements that are included in all Preselections that include  
13 the same main element. Preselections are defined by the metadata that is assigned to each of the  
14 elements that are included in the Preselection.

15 Note: This signaling may be simple for basic use cases, but is expected to not provide full coverage for all  
16 use cases.

17 Note: The signaling constraints in Table 6 apply on Adaptation Set level if the Preselection property de-  
18 scriptor is used.

#### 19 5.4.3.5. Staggercast Audio Descriptor

20 Staggercast is a robustness feature that can be optionally added to a program. It consists of deliv-  
21 ering a redundant version of the audio possibly coded with lower quality (e.g. lower bitrate, num-  
22 ber of channels, etc.) and with a significant lead ahead of the audio with which it is associated.

23 Note: For live content, staggercast audio stream may be sent ahead of the main audio stream by, for instance,  
24 taking advantage of the internal delay of encoding a video GoP. "

25 Receivers that support the Staggercast feature can switch to the Staggercast stream should main  
26 audio become unavailable. The delivery offset (delay) between Staggercast audio and regular au-  
27 dio should be chosen high enough to provide robustness given the sufficient time diversity between  
28 both audio streams.

29 To explicitly signal that a Representation is only suitable for Staggercast, a scheme is defined to  
30 be used with an Essential Property Descriptor as "http://dashif.org/guidelines/dash-atsc-  
31 staggercast". The value of the Descriptor is a comma-separated list of the id attribute of the  
32 Adaptation Sets to which the Staggercast Representation belongs.

33 To enable staggercast audio impairment capability, the MPD shall be constructed as follows:

- 34 • Include an additional Adaptation Set that that contains one and only one Staggercast audio  
35 Representation.
- 36 • Annotate the Adaptation Set with a Staggercast Audio descriptor.

- 1 • Staggercast Representation shall be time-aligned with the Representation it belongs to in the  
2 main Adaptation Set.

3 If an Adaptation Set is annotated with a Staggercast Descriptor then the receiver is expected to not  
4 select such Representation for regular playout. If the receiver supports the Staggercast feature, it  
5 is expected to buffer both the main audio and the Staggercast audio in order to be able to switch to  
6 the Staggercast audio, should main audio become unavailable.

7 Note: The amount of delay between main audio and Staggercast audio can be inferred from the MPD by  
8 comparing the value of the @availabilityTimeOffset information of the two Adaptation Sets.

#### 9 5.4.4. Codec-specific Issues

##### 10 5.4.4.1. Introduction

11 This section provides codec-specific issues that on how codecs can be mapped on the generic data  
12 structure defined in clause 5.4.3. This typically includes for each codec

- 13 • Codecs parameter settings
- 14 • Usage of the Preselection elements
- 15 • Random Access Point and Switching Point requirements
- 16 • The definition of bitstream switching or media level switching
- 17 • File format encapsulation requirements

##### 18 5.4.4.2. Dolby AC-4 specific details

###### 19 5.4.4.2.1. General

20 This section provides more details on Attributes and Elements used with AC-4. See ATSC A/342-  
21 2 [8].

22 ISO Base Media File Format Packaging Rules for AC-4 are described in ATSC A/342-2 [8], sec-  
23 tion 5.6. Random Access and Bitstream Switching is defined in ATSC A/342-2 [8], section 5.6.4.

24 Table 7 provides the element and attribute settings for AC-4.

25 Table 7 – AC-4 Elements and Attributes

Element or Attribute Name	Description
@codecs	<p>For AC-4 the value of the codecs attribute shall be created according to the syntax described in RFC 6381 [22].</p> <p>The value shall consist of the dot-separated list of the 4 following parts of which the latter three are represented by two-digit hexadecimal numbers:</p> <ul style="list-style-type: none"> <li>• The fourCC "ac-4"</li> <li>• The bitstream_version as indicated in the ac4_dsi_v1 structure.</li> <li>• The presentation_version as indicated for the selected presentation in the ac4_dsi_v1 structure.</li> <li>• The mdcompat parameter as indicated in the ac4_presentation_v1_dsi structure of the selected presentation.</li> </ul> <p>Example: "ac-4.02.01.03"</p>

	The AC-4 <code>ac4_dsi_v1</code> structure is described in Annex E of ETSI TS 103 190-2 [21].
<b>Preselection@tag</b>	This field shall correspond to the value of the <code>presentation_group_index</code> in the <code>ac4_presentation_v1_dsi</code> associated with an AC-4 presentation within the <code>ac4_dsi_v1</code> structure.
<b>AdaptationSet@tag</b>	This field shall correspond to the value of the <code>presentation_group_index</code> in the <code>ac4_presentation_v1_dsi</code> associated with an AC-4 presentation within the <code>ac4_dsi_v1</code> structure.
<b>ContentComponent@tag</b>	This field shall correspond to the value of the <code>presentation_group_index</code> in the <code>ac4_presentation_v1_dsi</code> associated with an AC-4 presentation within the <code>ac4_dsi_v1</code> structure.
<b>AudioChannelConfiguration</b>	<p>For AC-4 the Audio Channel Configuration descriptor shall use the "tag:dolby.com,2015:dash:audio_channel_configuration:2015" scheme URI. The value shall contain a six-digit hexadecimal representation of a 24-bit speaker group index bit field, which describes the channel assignment of the referenced AC-4 bit stream according to Table 27 in Annex A.3 of ETSI TS 103 190-2 [21]. This value is represented by the <code>presentation_channel_mask_v1</code> parameter in the <code>ac4_dsi_v1</code> structure.</p> <p>For example, for a stream with an 3/2/2 (5.1.2) Immersive Audio channel configuration using speakers L, R, C, Ls, Rs, TL, TR, LFE, the value shall be "E30000" (hexadecimal equivalent of the binary value 1110 0011 0000 0000 0000).</p> <p>The parameter <code>b_presentation_channel_coded</code> in the <code>ac4_dsi_v1</code> structure indicates <code>false</code> if the audio contains objects.</p> <p>For content that conveys audio objects that may be rendered to positions/coordinates independent from speaker configurations, the hexadecimal value "000000" should be indicated.</p>
<b>@audioSamplingRate</b>	<p>Example: "48000" for 48 kHz</p> <p>The indication shall correspond to the sampling frequency derived from the parameters <code>fs_index</code> and <code>dsi_sf_multiplier</code> inside the <code>ac4_dsi_v1</code> structure described in Table E.4 in Annex E.9.3 of ETSI TS 103 190-2 [21].</p>
<b>@mimeType</b>	The MIME type to be used with AC-4 shall be "audio/mp4".
<b>RandomAccess</b>	The type to be used with AC-4 shall be "closed", i.e. the SAP type is 1.
<b>Language</b>	The language indicated should correspond to the information conveyed in the <code>language_tag_bytes</code> of the <code>ac4_substream_group_dsi</code> structure (within the <code>ac4_dsi_v1</code> structure) which is tagged as "dialog" or "complete main" in the corresponding <code>content_classifier</code> .
<b>Role</b>	<p>The <code>Role@value</code> should be set by the content author.</p> <p>Note: The indication of the <code>content_classifier</code> from the <code>ac4_substream_group_dsi</code> structure is not sufficient to enable setting of an accurate indication for the <code>Role</code> descriptor in context of Preselections, describing entire experiences rather than individual audio elements.</p>
<b>Accessibility</b>	The <code>content_classifier</code> field in the <code>ac4_substream_group_dsi</code> structure defined in ETSI TS 103 190-2 [21] describes the type of audio conveyed by audio elements.

	<p>In case one or more audio elements related to an AC-4 Preselection indicate “visually impaired”, an Accessibility descriptor shall indicate “descriptions” according to the Role scheme defined in ISO/IEC 23009-1 [2].</p> <p>If one or more audio elements referenced by an AC-4 Preselection indicate a content type other than “music and effects” by means of the corresponding <code>content_classifier</code>, an Accessibility descriptor with the value “enhanced-audio-intelligibility” according to the Role scheme defined in ISO/IEC 23009-1 [2] may be used to indicate that the AC-4 Preselection enables the ability for a receiver to change the relative level of dialog to enhance dialog intelligibility.</p> <p>In case one or more audio elements related to an AC-4 Preselection indicate “Associated service: emergency (E)” by means of the value ‘110’ in the corresponding <code>content_classifier</code>, an Accessibility descriptor shall indicate “emergency” according to the Role scheme defined in ISO/IEC 23009-1.</p>
<b>Label</b>	The Label for a Representation should be set by the content author.

1

2 The value of the Preselection Property Descriptor provides two fields, separated by a comma:

- 3 • The first field shall correspond to the value of the `presentation_group_index` in the
- 4 `ac4_presentation_v1_dsi` associated with an AC-4 presentation within the
- 5 `ac4_dsi_v1` structure.
- 6 • The second field shall contain the whitespace separated list of **AdaptationSet** or **ContentComponent** ids which are included in the indicated Presentation.

8 5.4.4.2.2. Immersive Audio for Headphones Content Descriptor

9 If the content of an AC-4 Preselection has been tailored for headphones and therefore should be  
 10 rendered on headphones, a Supplemental Property Descriptor should be used to indicate this prop-  
 11 erty.

12 For AC-4 the Immersive Audio for Headphones Content Descriptor uses the  
 13 ”tag:dolby.com,2016:dash:virtualized\_content:2016” scheme URI.

14 The value is set according to the `b_pre_virtualized` flag from the corresponding presen-  
 15 tation\_v1\_dsi in the `ac4_dsi_v1` defined in ETSI TS 103 190-2 [21].

16 5.4.4.3. MPEG-H Audio specific details

17 5.4.4.3.1. Packaging for ISOBMFF

18 5.4.4.3.1.1. MPEG-H Audio specific details

19 The storage of MPEG-H Audio is specified in ISO/IEC 23008-3:2015/Amd 2 [18]. Additional  
 20 constraints on the audio elementary stream are specified in ISO/IEC 23008-3:2015 section 5.5.6  
 21 and section 5.7 [18]. See also ATSC A/342-3 section 5.2 [9] for constraints in the context of ATSC  
 22 3.0.

23 5.4.4.3.1.2. ISOBMFF sample entry

24 MPEG-H Audio supports both, storage of raw Access Units (AU) and storage of MHAS streams  
 25 in the ISOBMFF. For this profile only MHAS streams shall be used. The sample entry in ISO-  
 26 BMFF shall be `\mhm1` for single streams and `\mhm2` when multiple streams are used. MHAS  
 27 allows the in-band signaling of configuration information that can be used, e.g. for dynamic re-  
 28 configurations at Segment boundaries for easy ad-insertion as well as general purpose splicing and

1 trimming operations. MHAS is defined in 23008-3 section 14 [18]. Further, all rules and con-  
 2 straints specified in ATSC A/342-3 section 5.2.1 [9] apply.

3 5.4.4.3.1.3. Random Access and Bitstream Switching

4 Random Access and Stream Access Points for MPEG-H 3D Audio are described in section 5.7 of  
 5 ISO/IEC 23008-3:2015 [18].

6 For delay-free priming of the decoder, the first AU of the audio stream shall contain an `Audio-`  
 7 `PreRoll()` element with `numPreRollFrames` set to 1 according to ISO/IEC 23008-3:2015 Amd 3  
 8 [18].

9 The `MHASPacketLabel` shall have different values for all representations of an adaptation set.  
 10 Further, all rules and constraints specified in ATSC A/342-3 section 5.2.2 [9] apply.

11 In case of hybrid broadcast/broadband or multi-stream delivery the Random Access Points of all  
 12 streams within a bundle shall be aligned.

13 For Stream Access Points that are supposed to be used for seamless switching, the same restrictions  
 14 apply.

15 Table 8 MPEG-H Audio Elements and Attributes

Element or Attribute Name	Description
@codecs	For MPEG-H Audio, the value of the codecs attribute shall be created according to the syntax described in RFC 6381 [22].  The value consists of the following two parts separated by a dot: <ul style="list-style-type: none"> <li>• The fourCC "mhm1"</li> <li>• The hex value of the profile-level-id starting with '0x'</li> </ul> Example: "mhm1.0x0D"  The profile-level-id is defined in ISO/IEC 23008-3 [18]
<b>AdaptationSet</b> @tag	This field lists the <code>mae_groupIDs</code> as defined in ISO/IEC 23008-3 [18] that are contained in the Adaptation Set separated by white spaces.
<b>Preselection</b> @tag	This field indicates the <code>mae_groupPresetID</code> as defined in ISO/IEC 23008-3 [18] that refers to a Preset in scope of MPEG-H Audio.
<b>ContentComponent</b> @tag	This field indicates the <code>mae_groupID</code> as defined in ISO/IEC 23008-3 [18] which is contained in the Media Content Component.
<b>AudioChannelConfiguration</b>	For MPEG-H Audio, the Audio Channel Configuration descriptor shall use the "urn:mpeg:mpegB:cicp:ChannelConfiguration" scheme URI. The value shall be taken from the <code>ChannelConfiguration</code> table as defined in ISO/IEC 23001-8 [17]. Valid numbers for value are 1-7,9-12, 14-17 or 19
@audioSamplingRate	Example: "48000" for 48 kHz  The indication shall correspond to the sampling frequency derived from the <code>usacSamplingFrequencyIndex</code> or <code>usacSamplingFrequency</code> as defined in ISO/IEC 23003-3.
<b>RandomAccess</b>	The type to be used with MPEG-H Audio shall be "closed", i.e. the SAP type is 1.
@mimeType	The MIME type to be used with MPEG-H Audio shall be "audio/mp4".

<b>Language</b>	The language indicated should correspond to the information conveyed in <code>mae_contentLanguage</code> of the default dialog element: The <code>maeGroup</code> which is marked as default in <code>mae_switchGroupDefaultGroupID</code> and is tagged in <code>mae_contentKind</code> as <code>dialogue</code> . This information is carried in the <code>AudioSceneInformation()</code> of the MPEG-H Audio stream as defined in ISO/IEC 23008-3.
<b>Role</b>	The Role for a Preselection should be set by the content author.
<b>Accessibility</b>	<p>If the <code>mae_contentKind</code> value of at least one Audio Element is set to '9' ("audio-description/visually impaired"), an Accessibility descriptor shall indicate "descriptions" according to the Role scheme defined in ISO/IEC 23009-1 [2].</p> <p>If at least the Audio Elements with a <code>mae_contentKind</code> value of '2' ("dialogue") have <code>mae_allowGainInteractivity</code> set to '1' and <code>mae_interactivityMaxGain</code> set to a non-zero value in the corresponding <code>mae_GroupDefinition()</code> structure, an Accessibility descriptor with the value "enhanced-audio-intelligibility" according to the Role scheme defined in ISO/IEC 23009-1 [2] may be used to indicate that the Preselection enables the ability for a receiver to change the relative level of dialog to enhance dialog intelligibility.</p> <p>the <code>mae_contentKind</code> value of at least one Audio Element is set to '12' ("emergency"), an Accessibility descriptor shall indicate "emergency" according to the Role scheme defined in ISO/IEC 23009-1.</p> <p>The accessibility information indicated for a Preselection should also correspond to the <code>mae_groupPresetKind</code>.</p> <p>The <code>mae_contentKind</code> field and all other fields mentioned above that start with a "mae_" prefix are carried in the <code>AudioSceneInformation()</code> of the MPEG-H Audio stream as defined in ISO/IEC 23008-3.</p>
<b>Label</b>	The Label for a Preselection should be set by the content author.

- 1 The value of the Preselection Property Descriptor provides two fields, separated by a comma:
- 2     • The first field shall correspond to the value of the `mae_groupPresetID` as defined in
- 3     ISO/IEC 23008-3 [18] that refers to a Preset in scope of MPEG-H Audio.
- 4     • The second field shall contain the whitespace separated list of `Adaptation Set` or `Content Component` ids which are included in the indicated Preset.

#### 6 5.4.5. Service Offering Requirements and Recommendations

7 Note: this section will be provided in the next revision of this document following the

8 multi-track work currently completed in DASH-IF including Accessibility use cases.

#### 9 5.4.6. Expected Client Behavior

10 Note: this section will be provided in the next revision of this document following the

11 multi-track work currently completed in DASH-IF.

## 12 5.5. Subtitling and Closed Captioning

### 13 5.5.1. Background and Use Cases (Informative)

14 ATSC 3.0 subtitles and closed captioning is defined in A/343 [10] which is based on W3C TTML

15 IMSC1 as profiled in DASH-IF IOP [1]. Two profiles are included:

- 16     • Text Profile requiring a font rendering engine in the decoder
- 17     • Image Profile with PNG files

---

1 ATSC 3.0 Closed Captions are required to be carried as files and to be presented appropriately for  
2 ATSC 3.0 Video (e.g., 3D, HDR video). In order to provide the signaling of the presence of timed  
3 text-based data streams and closed captioning services on MPD level, descriptors on DASH level  
4 are defined.

### 5 5.5.2. Assumptions

6 The following closed caption metadata as provided in ATSC A/343, section 7.1 [10] is expected  
7 to be present for certain Adaptation Sets and Representations to enable suitable initial selection  
8 and switching:

- 9 • Language: the dominant language of the closed caption text
- 10 • Role: the purpose of the closed caption text, e.g., main, alternate, commentary.
- 11 • Display aspect ratio: the display aspect ratio assumed by the caption authoring in format-  
12 ting the caption windows and contents.
- 13 • Easy reader: this metadata, when present, indicates that the closed caption text tailored to  
14 the needs of beginning readers
- 15 • Profile: this metadata indicates whether text or image profile is used.
- 16 • 3D support: this metadata, when present, indicates that the closed caption text is tailored  
17 for both 2D and 3D video.

### 18 5.5.3. Service Offering Requirements and Recommendations

#### 19 5.5.3.1. DASH-specific aspects for Timed Text based Closed Caption

20 All constraints of DASH-IF IOP, section 6.4.4 [1] are applied; 14496-30 COR1 and COR2 [19]  
21 are applied.

- 22 • Mix of 2D and 3D closed captioning data per Period shall not be allowed.
- 23 • Only ISOBMFF encapsulation is permitted; and thus the only @codecs values are  
24 "sbttml.im1t" or "stpp.ttml.im1i".

#### 25 5.5.3.2. MPD-based Signaling of Timed Text based Closed Caption service metadata

26 This subsection provides methods MPD-based Signaling of Timed Text based Closed Caption  
27 services. Closed Caption metadata should be signaled properly using descriptors available in  
28 ISO/IEC 23009-1, specifically Role, Essential Property and Supplemental Property descriptors.

29 The language attribute shall be set on the Adaptation Set. Role element shall be used as necessary  
30 and the DASH role scheme may be used.

31 The Essential Property and/or Supplemental Property descriptors with the @schemeIdURI equal  
32 to "http://dashif.org/guidelines/dash-atsc-closedcaption", and @value attribute to  
33 contain the Caption Service Metadata described in section 7.1 in [A/343] as a semicolon-separated  
34 string. The @value syntax shall be as described in the ABNF below.

```
35 @value = "ar" ":" aspect-ratio ["," easy-reader] ["," profile] ["," 3d-support]  
36 aspect-ratio = (%d1-%d99) "-" (%d1-%d99)  
37 easy-reader = "er" ":" BIT; default value 0  
38 profile = "profile" ":" BIT; default value 0 for text profile  
39 3d-support = "3d" ":" BIT; default value 0
```

40 Based on the above ABNF, following parameters are defined for Timed Text Closed Caption  
41 metadata:

- 
- 1 • `aspect-ratio` may be set to any value pairs, including: “4-3”, “16-9”, and “21-9”.
  - 2 • `easy-reader` shall be set as a Boolean value; it is set as ‘1’ if present, otherwise the default
  - 3 is 0.
  - 4 • `profile` shall be set as a Boolean value; it is set as ‘1’ for image profile if present, other-
  - 5 wise the default is 0 for text profile.
  - 6 • `3d-support` shall be set as a Boolean value; it is set as ‘1’ if the 3D is supported, otherwise
  - 7 the default is 0.

## 8 5.6. Interactivity Events

### 9 5.6.1. Background and Basic Use Cases (Informative)

10 ATSC 3.0 Application Signaling specifies mechanisms for signaling app-based enhancements in  
11 both linear services containing app-based enhancements and standalone app-based services (which  
12 consist entirely of app-based enhancements), as well as mechanisms for delivering activation no-  
13 tifications, or “events” which activate or change the state of the associated applications at precise  
14 times in the media presentation timeline and can be mapped to wall-clock time. The details of  
15 application signaling are specified in A/337 [6]. Note that this section only deals with IF-1 of  
16 Figure 2, i.e. events and triggers as defined in A/337 [6]. Generic events may be used as well, and  
17 if so, they may be using IF-3 in Figure 2, as for example discussed in clause 6. Note also that the  
18 function “ATSC events” in Figure 2 may be part of the Application and therefore IF-1 and IF-3  
19 coincide.

20 Some relevant feature for event signaling are summarized. The format is expected to support sig-  
21 naling of events with precise timing such that the action of the triggered application operations can  
22 be synchronized. The format is expected to support signaling of a series of events. The format is  
23 expected to support signaling of events using the MPD as well as part of Media Segments of Rep-  
24 resentations, e.g., using the ‘`emsg`’ box [2]. Both broadcast- and broadband-delivered content may  
25 support events.

### 26 5.6.2. Mapping to DASH

27 The existing MPEG-DASH Event Mechanism as defined in ISO/IEC 23009-1, clause 5.10, shall  
28 be used to carry ATSC events. The working draft of ATSC A/337[5], section 5.4 defines the ATSC  
29 events including a scheme ID URI as well as values for different events (a table update Event  
30 Stream used in the context of devices that have access to an ATSC 3.0 broadcast stream, and for a  
31 table update Event Stream used in a redistribution setting).

32 Application-specific Event Streams may be defined by application developers. The only con-  
33 straints are that the `schemeIdUri/value` combination must be globally unique, such as by the use  
34 of a `schemeIdUri` controlled by the application developer, and by proper management of the value  
35 attributes. In order to get access to these Events, applications register callback routines for them,  
36 and the callback routines are called when such Events arrive.

### 37 5.6.3. Service Offering Requirements and Recommendations

38 Interactivity Events may be carried:

- 39 - As MPD Events as defined in ISO/IEC 23009-1, clause 5.10.2
- 40 - As Inband events as defined in ISO/IEC 23009-1, clause 5.10.3

---

1 If Inband events are used, then at least all Representations of all main audio Adaptation Sets shall  
2 contain an **InbandEventStream** element with @schemeIdUri set to the ATSC-defined  
3 value. In addition, all non-dependent Representations of at least one media type/group should con-  
4 tain an **InbandEventStream** element with @schemeIdUri set to the ATSC-defined value.

#### 5 5.6.4. Expected Client Behavior

6 The DASH client shall download at least one Representation that contains InbandEvent-  
7 Stream element set to the ATSC-defined value.

8 The process as defined in clause 4.4 is expected to be used.

9 The event information is handed to the ATSC event function.

## 10 5.7. Programs and Program Ratings

### 11 5.7.1. Program Definition in ATSC

12 According to ATSC, a Program is defined as follows:

13 *Program — Content of a defined composition and scheduled duration intended by the*  
14 *broadcaster to be treated as a programming unit.*

15 Programs may map to a content fragment identified in the Electronic Service Guide (ESG).

### 16 5.7.2. Program Signaling

17 Program signaling is out of scope for this profile.

### 18 5.7.3. Program Rating Signaling in DASH

19 When using DASH, the ratings value shall be specified by the **MPD.Period.Adaptation-**  
20 **Set.Rating** element. When the content advisory corresponds to a rating system defined by an  
21 RRT, the value of **Rating@schemeIdUri** shall be set equal to  
22 "http://dashif.org/guidelines/dash-atsc-RRTrating:1". The @value string  
23 shall be set equal to the content advisory ratings string specified in A/331 Section 7.3.1 [4]. Alter-  
24 natively or in addition, content advisories corresponding to other rating systems may be included.  
25 For content advisories not corresponding to defined RRTs, different **Rating@schemeIdUri**  
26 values shall be used, as specified by appropriate regional authorities.

27 The **Rating** element is a child element of **AdaptationSet**, thus any or all Adaptation Sets in  
28 a Period could be labeled with a content advisory. When the entire Program is to be associated with  
29 one content advisory rating (the usual case), at least one instance of the Rating element with a value  
30 of "http://dashif.org/guidelines/dash-atsc-RRTrating:1" for **Rat-**  
31 **ing@schemeIdUri** shall be included in the Period as an **MPD.Period.Adaptation-**  
32 **Set.Rating** element. Multiple Rating elements with different values for **Rating@schemeI-**  
33 **dUri** may be included in the Period as **MPD.Period.AdaptationSet.Rating** elements. In  
34 the DASH MPD no **ContentComponent** element shall include a **Rating** element.

35 The rules for placement of a **Rating** element with a value of  
36 "http://dashif.org/guidelines/dash-atsc-RRTrating:1" for **Rat-**  
37 **ing@schemeIdUri** shall be as follows:

- 
- 1 • When a Period includes only one Adaptation Set containing one or more video compo-  
2 nents (e.g. those with @mimeType="video/mp4"), the **Rating** element shall ap-  
3 pear in that **AdaptationSet**.
  - 4 • When a Period includes multiple Adaptation Sets each with @mime-  
5 Type="video/mp4" containing video components, the Rating element shall appear in  
6 each Adaptation Set among these whose **Role**@schemeIdUri is equal to  
7 "urn:mpeg:dash:role:2011" and **Role**@value is equal to "main".
  - 8 • When a Period includes no Adaptation Sets describing video components, i.e. none of  
9 the **AdaptationSet** elements have @mimeType="video/mp4", the Rating ele-  
10 ment shall appear in each **AdaptationSet** listed in the MPD for that Period.

## 11 6. Ad Insertion

### 12 6.1. Background (Informative)

13 An ATSC 3.0 receiver accesses broadcast signaling identifying the availability of streaming ser-  
14 vices delivered within the broadcast stream, by broadband, or by a combination of the two (hybrid  
15 services). An ATSC 3.0 receiver which supports the application runtime environment defined in  
16 A/344 [11] can, under the control of a broadcaster-supplied application, present personalized ads  
17 to the viewer. When a personalized ad is played, it replaces the content that is present in the regular  
18 stream (e.g. content that is played by receivers not supporting the runtime environment).

19 As described in the Client Reference Model in Section 2.3.2, receivers include a DASH Player that  
20 is responsible for managing the playout of DASH Media Segments. The locations of ad avails are  
21 defined as DASH Periods. The MPD delivered in the signaling can identify one or more ad avails  
22 by placing an XLink in a future Period. When the DASH Player sees an MPD update containing  
23 an XLink, it interacts with the broadcaster application over interface IF-3 to attempt to resolve it.  
24 If resolution is successful, one or more Period elements are returned to the DASH Player, which  
25 replaces the Period that had contained the XLink with the one or more new Period elements.

26 Personalized ad insertion requires making choices about which ad content is appropriate for a par-  
27 ticular viewer. In the ATSC 3.0 receiver, such choices are made by the broadcaster application.  
28 Once an XLink to be resolved is received by the app, it can perform appropriate logical operations,  
29 using whatever personalization information it has access to, to choose the appropriate ad content.  
30 Alternatively, the app might pass the XLink, with appropriate query terms, to a broadcaster server  
31 which would perform the decision logic.

### 32 6.2. Use Cases (Informative)

#### 33 6.2.1. Series Fan

34 The broadcaster wishes to target personalized ads to fans of a certain TV series. Based on Joe's  
35 recent viewing of six hours of the "marathon" for this series, he is presented with an ad for mem-  
36 orabilia, while others in his neighborhood view different advertising in that slot.

---

### 1 6.2.2. Swing Shift Viewer

2 Based on Ted's TV viewing hours being predominantly in the 11pm to 4am time period, he is  
3 presented with an ad for employment services, while others in his neighborhood view different  
4 advertising in that slot.

### 5 6.2.3. Young Cat Lover

6 Emily had interacted with her favorite cartoon show on Saturday to indicate her love of cats. On  
7 Sunday morning, she is presented with an ad for cat toys, while others in her neighborhood are  
8 presented with ads for different products.

### 9 6.2.4. Geographic Location

10 A broadcaster wishes to play an ad for a car dealership local to the west side of town to those living  
11 there, and an ad for a different dealership to those living on the east side of town

### 12 6.2.5. Generic Personalized Ads

13 A viewer watching TV is presented personalized ads during broadcast ad spots. Characterization  
14 of typical decisions for personalized ad insertion include:

- 15 • Demographics (age, gender, location, income, education)
- 16 • Interests (arts & entertainment, finance, autos, cooking, survival, sports, etc.)
- 17 • Viewing behavior (program/channel selection, time of day, channel surfer, ads watched vs.  
18 skipped, etc.)
- 19 • Device characteristics (make/model/vintage, capabilities, etc.)

### 20 6.2.6. Incidence of Breaking News during Replacement Ad Viewing

21 A TV viewer is watching a replacement ad which is interrupted with breaking news. The replace-  
22 ment ad stops playing and the breaking news is viewed.

### 23 6.2.7. Trick Mode Access associated with Replacement Ad Viewing

24 A TV viewer watches a replacement ad during a previously recorded show. He/she is able to pause  
25 and rewind during that replacement ad.

### 26 6.2.8. Replacement Ad Containing Interactivity Components

27 A TV viewer watches a replacement ad that also has interactive elements. The user uses the TV  
28 remote control to start the interaction by highlighting and selecting an icon that is on-screen. Types  
29 of interactive elements might include:

- 30 • The ability to receive a coupon for a product by typing in their mobile phone number.
- 31 • View the location of the nearest car dealer onscreen in an overlay that does not interfere  
32 with critical visual elements of the ad.
- 33 • Get more detailed product information on a registered companion device (tablet or smart  
34 phone).

---

## 1 6.3. Assumptions

2 The following system aspects are assumed:

- 3 • The receiver implements the Application Runtime Environment specified in A/344 [11].
- 4 • Ad avails are identified by the placement of Periods with XLinks in the MPD.
- 5 • The receiver's DASH Player resolves ATSC app-specific XLinks by interacting with the  
6 broadcaster-supplied application through the JSON WebSocket RPC API defined in A/344  
7 [11].
- 8 • Non-personalized ads may be included in broadcast content, either not exposed as separate  
9 Periods or associated with Periods.
- 10 • XLink resolution may fail. In that case, the client is expected to delete the XLink and use  
11 the default Content.
- 12 • XLinks to be communicated to the broadcaster application are identified as such by a spec-  
13 ified URI pattern in the href attribute. Xlinks not matching the pattern may appear, includ-  
14 ing for example http(s) URLs. Receivers not supporting a given form of XLink resolution  
15 are expected to delete the associated XLinks from the Period.
- 16 • The broadcaster app, at the discretion of the app designer and subject to the availability of  
17 broadband access, may append personalization data to an XLink and forward it to a broad-  
18 caster's resolution server for processing. Upon receiving a response from the broadcaster  
19 server, the replacement Period(s) may be returned to the receiver's DASH player using the  
20 XLink resolution API defined in A/344 [11].

## 21 6.4. Service Offering Requirements and Recommendations

### 22 6.4.1. General

23 Service offering should follow the server-driven ad insertion approach, as defined in DASH-IF  
24 IOP [1], clause 5.3, which uses remote periods to represent avails. Remote period resolution is  
25 performed by a broadcaster-supplied app.

26 The service offering may contain inband 'emsg' boxes or/and **EventStream** elements, carry-  
27 ing payloads such as SCTE 35 cue messages. Treatment of specific event payloads is outside the  
28 scope of this document, and the client is expected to be able to play seamlessly irrespective of  
29 whether the above events were handled by an application.

### 30 6.4.2. Remote Periods

31 An avail is represented by one or more remote Period elements.

32 Each remote Period element shall contain "default content", i.e., it would be a playable non-empty  
33 Period would its **Period**@xlink:href attribute be deleted.

34 If the **Period**@xlink:href attribute is present, the @xlink:actuate attribute shall be pre-  
35 sent and have the value "onLoad".

---

### 1 6.4.3. XLink API

2 An XLink to be resolved by a broadcaster-supplied application is identified by a  
3 **period@xlink:href** attribute containing a URI conforming to a format specified in A/344 [11].  
4 Resolution of Remote Periods with such URIs is expected to be handled by applications and is  
5 outside the scope of this document.

## 6 6.5. Expected Client Behavior

### 7 6.5.1. XLink

8 MPD Periods with XLink URIs conforming to a format specified in A/344 [12] are resolved by  
9 local apps via the JSON-RPC API defined in A/344 [11].

10 If Remote Period dereferencing time exceeds 3 seconds, the client should assume that dereferenc-  
11 ing failed. The consequence is no modification to the broadcast MPD and thus playback of the  
12 “default” content.

### 13 6.5.2. Events

14 Events are expected to be passed to apps using same mechanism as described in clause 5.6.4,  
15 however events with non-ATSC @schemeIdUri values should be expected. For more details on  
16 expected receiver handling, refer to clause 4.4.

## 17 7. DRM and Security

### 18 7.1. Introduction

19 The following describes the content protection and DRM solution using Common Encryption of  
20 media, and DASH MPD signaling of DRM licenses.

21 It is assumed that devices will connect to a DRM license server to receive a device or user specific  
22 license that will authorize access to protected content. The method and frequency of license server  
23 connection is a deployment choice and can range from one-time provisioning when a device is  
24 purchased, to unlimited on-demand online license downloads. Broadcast delivery of individualized  
25 licenses (cryptographically bound to a device or user) is not specified by DASH-IF.

26 Device independent “child” licenses that contain a Media Segment decryption key can be accessed  
27 by all authorized devices and users (with a “parent” license), and may be delivered in every Media  
28 Segment to facilitate random access and key rotation.

29 The model is based on a “parent/child” hierarchy of licenses and keys supporting “key rotation”  
30 and subscriptions at the content level. In addition to a common scrambling algorithm, the following  
31 steps are needed to authorize playback:

- 32 • Devices must be initialized and registered by an authorization server in order to identify  
33 the device or user to be authenticated and authorized, and must establish a cryptographic  
34 identity to a DRM client to allow the license server to generate cryptographically bound  
35 licenses. Note that different devices may use different DRM clients.

- 
- 1 • Devices need to retrieve device or user bound licenses that authorize a set of content deter-  
2 mined by the Operator, typically, a subscription to a service. A license may authorize  
3 limited permissions, such as a time limit, resolution limit, geographical limit, etc.
  - 4 • Optionally, enforcement of authorization may be repeated per program segment or time  
5 interval by changing the key used to encrypt corresponding Media Segments, thus requir-  
6 ing the DRM system to verify authorization for that device or user in order to extract the  
7 key delivered by a child license within the Broadcast stream.

8 Note that the system does not support broadcast-only distribution of individual licenses.

## 9 7.2. Device Initialization

10 DRM specific protocols are used for enabling the device in the operator network. It is a one-time  
11 operation requiring connections to the operator head-end for uniquely identifying and authenticat-  
12 ing the device. For example, the DRM system may perform an operation with a hardware embed-  
13 ded DRM client key, or may install a domain certificate on each authorized device belonging to a  
14 particular user so that a single license can authorize all the devices in that domain.

## 15 7.3. License Delivery

16 Licenses are retrieved by the device using DRM specific protocols. It requires connecting to au-  
17 thentication, authorization, and licensing servers. How often this connection is required depends  
18 on the validity period of the licenses that are delivered. This can be a one-time operation if the  
19 license has an infinite life time (some years) or this can be on a regular basis (e.g. every month)  
20 for renewing a subscription for example.

## 21 7.4. Key Rotation

22 Section of 7.5 of DASH-IF IOP [1] defines different mechanisms for key rotation. In ATSC 3.0,  
23 the key hierarchy as described in subsection 7.5.3.4 is to be used.

24 How often keys are rotated is a deployment choice. Typically, parent licenses at the Entitlement  
25 Management Level (EML or “parent license”) are expired every month for a subscription service  
26 so authorization will fail if a user stops their subscription. At the Entitlement Control Level (ECL),  
27 child licenses change more frequently, typically per show or time interval. Each change requires  
28 an authorization check because a valid parent license must be present in order to extract the new  
29 key from the child license in the Media Segment, so authorization limitations (location, expiration,  
30 resolution, etc.) will be checked by the DRM system. Historically, key rotation was used to pre-  
31 vent key factoring and distribution when 8-bit keys were used and factoring took minutes, later  
32 seconds. With Common Encryption and 128-bit keys, key factoring is no longer a reason to use  
33 frequent key rotation.

## 34 7.5. Content Encryption

35 Common ENCRyption (CENC) of NAL structure video and other media data with AES-128 CTR  
36 mode is used. The use of the cenc scheme follows guidelines defined in Section of 7.4 of DASH-  
37 IF IOP [1].

---

## 1 7.6. Manifest Signaling

2 DASH IF specifies the use of **ContentProtection** Descriptors in the MPD to identify:

3 1. **Adaptation Sets encrypted using a default\_KID.**

4 The **ContentProtection**@schemeIdUri="urn:mpeg:dash:mp4protec-  
5 tion:2011" contains the attribute `cenc:default_KID`, which equals the de-  
6 fault\_KID field in the Track Encryption Box ('`tenc`') of the Initialization Segments.

7 2. **DRM licenses that are available and necessary.**

8 There should be a ContentProtection Descriptor for each DRM system supported, identi-  
9 fied by a UUID, and containing any information defined by that DRM system. These  
10 **ContentProtection** Descriptors have @schemeId-  
11 dUri="urn:uuid:xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx", where the  
12 UUID value is registered at <http://www.dashif.org/identifiers/protection>.

13 A DASH player can make a license request or verify the presence of a license for the de-  
14 fault\_KID indicated and any of the DRM systems that it supports. That license can either  
15 provide the key to decrypt the content, or if a parent license, the key to access child licenses broad-  
16 cast in Media Segments that contain the keys to decrypt the content. Protection System Specific  
17 Header Boxes ('`pssh`') SHALL NOT be used in Initialization Segments to signal encryption or  
18 DRM licenses. Players SHOULD pass any '`pssh`' boxes present in Media Segments to the DRM  
19 system ("Content Decryption Module"). MPD signaling follows guidelines defined in Section of  
20 7.6 of DASH-IF IOP [1].

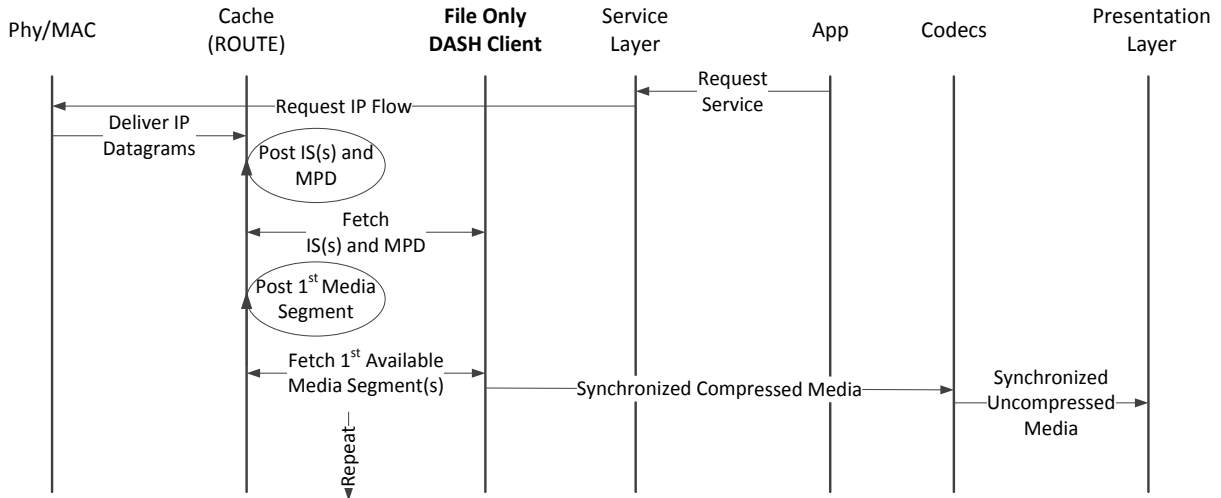

## 21 8. Relevant Use Cases and Content Offering Guidelines

22 Note: This section will be provided in the next revision of this document.

# 1 Annex A MDE Delivery Methods

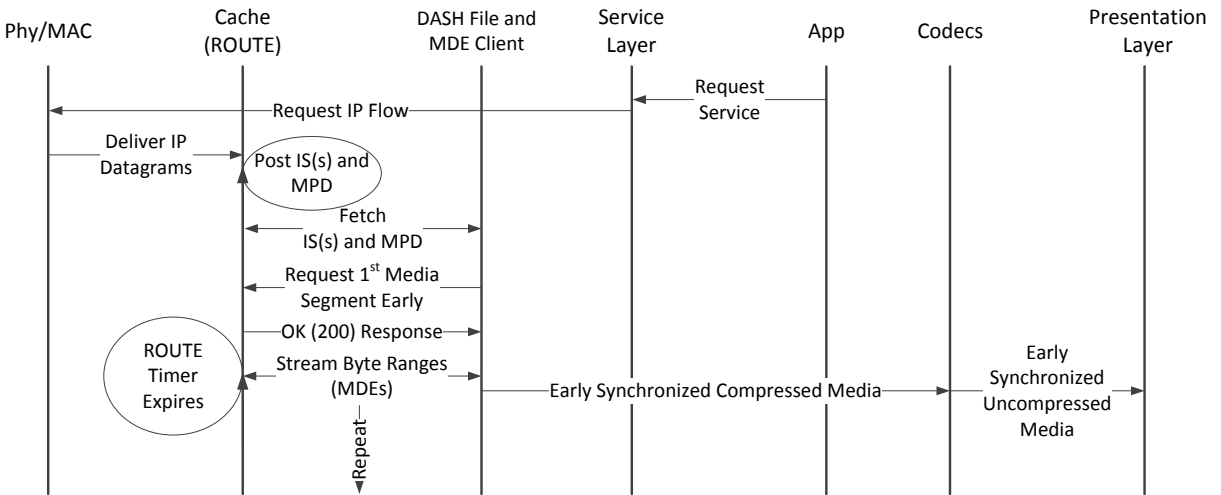

## 2 A.1 HTTP Media Segment Delivery

3 In conventional, HTTP file playback DASH client fetches Media Segments shortly after  
 4 they become available in the Cache as shown above in Figure A1.1.

5  
 6 Figure A1.1: Call Flow for HTTP File Delivery to DASH Client

7 For MDE delivery as shown below in Figure A1.2, the MDE aware DASH Client requests  
 8 the desired Media Segment prior to the MPD defined availability time and the Cache  
 9 streams MDEs to the DASH client upon expiry of the ROUTE timer for the requested Me-  
 10 dia Segment.

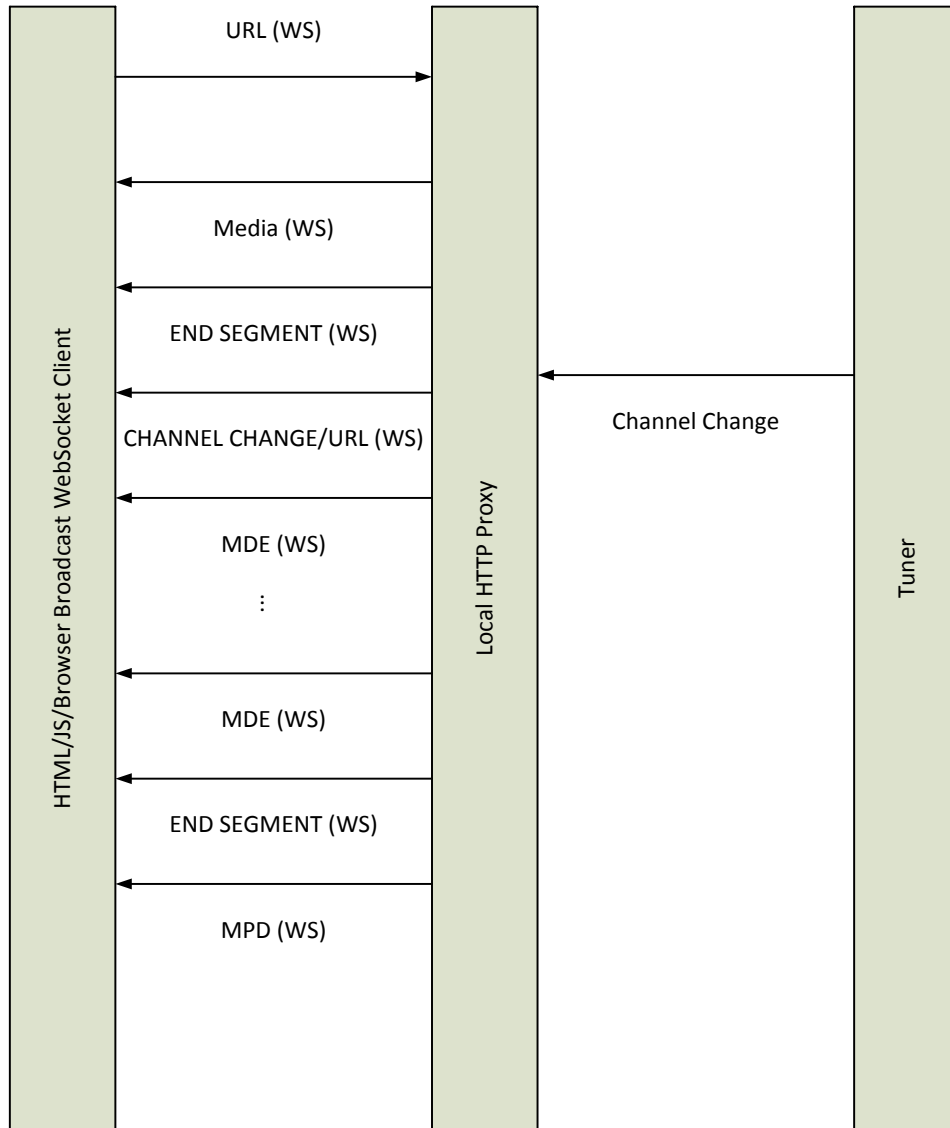

11  
 12 Figure A1.2: Call Flow for HTTP MDE Delivery to MDE Aware DASH Client

13

1 **A.2 Websocket Delivery of MDE**

2 Figure A2.1 above depicts a typical call flow for Websocket delivery of MDE to a client.  
3 The DASH client establishes a Websocket connection to the HTTP proxy via a well-known  
4 URL or address (e.g. ws://127.0.0.1:8080). In the drawing above, the DASH client can  
5 optionally receive notification of a channel change and immediately start receiving MDE's  
6 upon service acquisition. The MPD in this example is delivered in-band apriori as per the  
7 description in Section 2.7.3, which allows for hybrid use cases.

8  
9 Figure A2.1: Call Flow for Websocket Delivery of MDE  
10

# Annex B Broadcast TV Profile and Related Information from ISO/IEC 23009-1 Amd.4

Note: This Annex will be removed once ISO/IEC 23009-1:2017 [2] is available. The section numbers replicate the numbers in ISO/IEC 23009-1.

## 5.3.3.4 Switching within Adaptation Sets

Switching refers to the presentation of decoded data from one Representation up to a certain time  $t$ , and presentation of decoded data of another Representation from time  $t$  onwards, for details refer to 4.3.

The **Switching** element as defined in Table AAA provides instructions of switch points within an Adaptation Set and the permitted switching options as defined in Table BBB. When this element is present, it signals opportunities for simple switching across Representations in one Adaptation Set. This element may be used instead of the attributes `@segmentAlignment` or `@bitstreamSwitching`.

Table BBB defines different switching strategies that provide instructions to the client on the procedures to switch appropriately within an Adaptation Set.

**Table AAA — Switch Point Signalling**

Element or Attribute Name	Use	Description
<b>Switching</b>		Switching logic description for the associated Representation
<code>@interval</code>	M	<p>specifies the interval between two switching points in the scale of the <code>@timescale</code> on Representation level. Any Segment for which the earliest presentation time minus the <code>@t</code> value of the <code>s</code> element describing the segment is an integer multiple of the product of <code>@timescale</code> and <code>@interval</code> is a switch-to opportunity, i.e. it enables to switch to this Representation with the switching strategy as defined by the <code>@type</code> value.</p> <p>The value should be chosen such that the resulting time matches MPD start time of segments, otherwise no switching will be described</p>

Element or Attribute Name	Use	Description
@type	OD default: 'media'	specifies the switching strategy for the switch points identified in by the @interval attribute. Switching strategies are defined in Table BBB.

1  
2

**Table BBB — Switching Strategies**

Type	Description
media	Media level switching: In this case switching is possible at the switch point by decoding and presenting switch-from Representation up to switch point t, initializing the switch-to Representation with the associated Initialization Segment and continue decoding and presenting the switch-to Representation from time t onwards.
bitstream	Bitstream switching: In this case switching is possible at the switch point by decoding and presenting switch-from Representation up to switch point t, and continue decoding and presenting the switch-to Representation from time t onwards. More specifically, the concatenation of two Representations at the switch point results in a "conforming Segment sequence" as defined in 4.5.4 with the media format as specified in the @mimeType attribute.  Initialization of the switch-to Representation is not necessary and is not recommended.  In order to enable this feature, it is recommended to use the same Initialization Segment for all Representations in the Adaptation Set, i.e. the highest profile/level is signaled in the Initialization Segment.

3  
4

The XML schema snippet is as follows:

```

<!-- Switching -->
<xs:complexType name="SwitchingType">
  <xs:attribute name="interval" type="xs:unsignedInt" use="required"/>
  <xs:attribute name="type" type="SwitchingTypeType"/>
  <xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:complexType>

<!--Switching Type type enumeration -->
<xs:simpleType name="SwitchingTypeType">
  <xs:restriction base="xs:string">
    <xs:enumeration value="media"/>
    <xs:enumeration value="bitstream"/>
  </xs:restriction>
</xs:simpleType>

```

5  
6

### 5.3.3.5 Switching across Adaptation Sets

7 Representations in two or more Adaptation Sets may provide the same content. In addi-  
8 tion, the content may be time-aligned and may be offered such that seamless switching  
9 across Representations in different Adaptation Sets is simplified. Typical examples are  
10 the offering of the same content with different codecs, for example H.264/AVC and  
11 H.265/HEVC and the content author wants to provide such information to the receiver in  
12 order to seamlessly switch Representations (as defined in 4.5.1) across different Adapta-  
13 tion Sets.

1 A content author may signal such seamless switching property across Adaptation Sets by  
 2 providing a Supplemental Descriptor along with an Adaptation Set with @schemeIdURI  
 3 set to urn:mpeg:dash:adaptation-set-switching:2016 and the @value is a  
 4 comma-separated list of Adaptation Set IDs that may be seamlessly switched to from this  
 5 Adaptation Set.

6 If the content author signals the ability of Adaptation Set switching and as @segmen-  
 7 tAlignment or @subsegmentAlignment are set to TRUE, the (Sub)Segment alignment  
 8 element shall be valid for aIIRepresentations in aIIAdaptation Sets for which the @id  
 9 value is included in the @value attribute of the Supplemental descriptor.

10 If the content author signals the ability of Adaptation Set switching and **Switching** ele-  
 11 ment is provided, the signaled switch points apply for aIIRepresentations in aIIAdaptation  
 12 Sets for which the @id value is included in the @value attribute of the Supplemental de-  
 13 scriptor.

14 As an example, a content author may signal that seamless switching across an  
 15 H.264/AVC Adaptation Set with **AdaptationSet@id="4"** and an HEVC Adaptation Set  
 16 with **AdaptationSet@id="5"** is possible by adding a Supplemental Descriptor to the  
 17 H.264/AVC Adaptation Set with @schemeIdURI set to urn:mpeg:dash:adaptation-  
 18 set-switching:2016 and the @value="5" and by adding a Supplemental Descriptor  
 19 to the HEVC Adaptation Set with @schemeIdURI set to urn:mpeg:dash:adapta-  
 20 tion-set-switching:2016 and the @value="4".

21 In addition, if the content author signals the ability of Adaptation Set switching for any  
 22 Adaptation Sets then the parameters as defined for an Adaption Set shall also hold for all  
 23 Adaptation Sets that are included in the @value attribute. Note that this constraint may  
 24 result that the switching may only be signaled with one Adaptation Set, but not with both  
 25 as for example one Adaptation Set signaling may include all spatial resolutions of another  
 26 one, whereas it is not the case the other way round.

27 5.3.5.5 Random Access to Representations

28 Random Access refers to start processing, decoding and presenting the Representation  
 29 from the random access point at time t onwards by initializing the Representation with the  
 30 Initialization Segment, if present and decoding and presenting the Representation from  
 31 the signaled Segment onwards. Random Access point may be signaled with the **Ran-**  
 32 **domAccess** element as defined in Table CCC.

33 Table DDD provides different random access point types.

34 **Table CCC — Random Access Signalling**

Element or Attribute Name	Use	Description
<b>RandomAccess</b>		Random Access Information
@interval	M	specifies the position of the random access points in the Representations. The information is specified in the scale of the

Element or Attribute Name	Use	Description
		<p><b>@timescale</b> on Representation level. Any Segment for which the MPD start time minus the @t value of the s element describing the segment is an integer multiple of the product of @timescale and @interval is a random access opportunity, i.e. it enables randomly access to this Representation with the random access strategy as defined by the @type value.</p> <p>The value should be chosen such that the resulting time matches MPD start time of segments, otherwise no random access will be described.</p>
@type	OD default: "closed"	<p>specifies the random access strategy for the random access points in by the @interval attribute.</p> <p>The value shall use a type present in Table DDD.</p> <p>If the value of the type is unknown, the DASH client is expected to ignore the containing Random Access element.</p>
@minBufferTime	O	<p>specifies a common duration used in the definition of the Representation data rate (see @bandwidth attribute in 5.3.5.2 and 5.3.5.4).</p> <p>If not present, then the value of the MPD level is inherited.</p>
@bandwidth	O	<p>Consider a hypothetical constant bitrate channel of bandwidth with the value of this attribute in bits per second (bps). Then, if the Representation is continuously delivered at this bitrate, starting at any RAP indicated in this element a client can be assured of having enough data for continuous playout providing playout begins after @minBufferTime * @bandwidth bits have been received (i.e. at time @minBufferTime after the first bit is received).</p> <p>For dependent Representations this value specifies the bandwidth according to the above definition for the aggregation of this Representation and all complementary Representations.</p> <p>For details see 5.3.5.4.</p> <p>If not present, the value of the Representation is inherited.</p>

1

**Table DDD — Random Access Strategies**

Type	Informative description
closed	Closed GOP random access. This implies that the segment is a Random Access Segment as well as the segment starts with a SAP type of 1 or 2. Note that SAP type 1 or 2 is a necessary condition, but not sufficient. In addition, all requirements of a Random Access Segment need to be fulfilled.
open	Open GOP random access. This implies that the segment is a Random Access Segment as well as the segment starts with a SAP type of 1, 2 or 3. Note that SAP type 1, 2 or 3 is a necessary condition, but not sufficient. In addition, all requirements of a Random Access Segment need to be fulfilled.
gradual	Gradual decoder refresh random access. This implies that the segment is a Random Access Segment as well as the segment starts with a SAP type of 1, 2, 3 or 4. Note that SAP type 1 2, 3 or 4 is a necessary condition, but not sufficient. In addition, all requirements of a Random Access Segment need to be fulfilled.

2 The XML schema snippet is as follows:

```

<!-- Random Access -->
<xs:complexType name="RandomAccessType">
  <xs:attribute name="interval" type="xs:unsignedInt" use="required"/>
  <xs:attribute name="type" type="RandomAccessTypeType"/>
  <xs:attribute name="minBufferTime" type="xs:duration"/>
  <xs:attribute name="bandwidth" type="xs:unsignedInt"/>
  <xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:complexType>

<!-- Random Access Type type enumeration -->
<xs:simpleType name="RandomAccessTypeType">
  <xs:restriction base="xs:string">
    <xs:enumeration value="closed"/>
    <xs:enumeration value="open"/>
    <xs:enumeration value="gradual"/>
  </xs:restriction>
</xs:simpleType>

```

3

### 4 8.11.1 General

5 This profile provides a restricted profile primarily for distributing broadcast TV over broad-  
6 cast and broadband services, including service offerings for combined unicast and broad-  
7 cast services. The profile is based on ISO-BMFF. In order to enable those advanced use cases,  
8 this profile introduces the main restrictions that follows compared to the extended live profile:.

- 9 - Use a single @timescale for all Representations in one Adaptation Set
- 10 - Use Segment Timeline for signaling of segment durations
  - 11 • The timing of the segments in the MPD is accurate
  - 12 • The Segment Timeline may be on Representation level to allow different
  - 13 segment durations in different Representations. However, it may be de-
  - 14 faulted on Adaptation Set level

- 
- 1           • The Segment Timeline may use open ended @r (-1) or closed @r (>=0)
  - 2           • The Segment Timeline may use Segment sequences and Hierarchical
  - 3            Templating
  - 4           • Each Representation shall provide at least one **RandomAccess** element.
  - 5           • If an Adaptation contains more than one Representation, then at least one
  - 6           **Switching** element shall be present.
  - 7           • Segment alignment and start with SAP signalling may be used for backward com-
  - 8           patible deployments, but should generally not be used.
  - 9           • Data URLs as defined in RFC2397 may be used for Initialization Segments.

10

11 The ISO-Base Media File Format Broadcast TV profile is identified by the following URN:  
12 "urn:mpeg:dash:profile:isoff-broadcast:2015" .

13

14 8.11.2 Media Presentation Description constraints

15 8.11.2.1 General

16 The Media Presentation Description shall conform to the following constraints:

17 — The rules for the MPD as defined in ISO/IEC 23009-1 7.3, shall apply.

18 — The rules for the Segments as defined in 7.3.5 of ISO/IEC 23009-1 shall apply.

19 — Periods which do not conform to the constraints in 8.11.2.2 may not be presented

20 — Representations not inferred to have @profiles equal to the profile identifier as de-  
21 fined in 8.11.1 may be ignored

22 8.11.2.2 Constraints on Period elements

23 — The **Subset** element may be ignored.

24 — The **Period.SegmentList** element shall not be present

25 — **AdaptationSet** elements that do not conform to 8.11.2.3 may be ignored

26 8.11.2.3 Constraints on AdaptationSet elements

27 — **AdaptationSet** element may be ignored unless **AdaptationSet.SegmentTem-**  
28 **plate** is present and/or for each Representation within this Adaptation Set **Repre-**  
29 **sentation.SegmentTemplate** element is present;

30 — **AdaptationSet** element may be ignored unless **AdaptationSet.RandomAc-**  
31 **cess** is present and/or for each Representation within this Adaptation Set **Repre-**  
32 **sentation.RandomAccess** element is present;

- 
- 1 — **AdaptationSet** element that contains more than one Representation may be ig-  
2 nored unless **AdaptationSet.Switching** is present and/or for each Representa-  
3 tion within this Adaptation Set **Representation.Switching** element is present  
4 and all the **SegmentTemplate** elements conform to 8.11.2.5;
- 5 — **InBandEventStream** shall only be used on Adaptation Set level.
- 6 — **Representation** elements that do not conform to 8.11.2.4 may be ignored
- 7 8.11.2.4 Constraints on Representation elements
- 8 — Representations with value of the @mimeType attribute other than video/mp4, au-  
9 dio/mp4, application/mp4, or text/mp4 may be ignored. Additional profile  
10 or codec specific parameters may be added to the value of the MIME type attribute.
- 11 — **Representation** elements may be ignored if **Representation.RandomAccess**  
12 element is not present and also no **AdaptationSet.RandomAccess** element is  
13 present.
- 14 — **InBandEventStream** shall not be present on Representation level.
- 15
- 16 — Segment Timeline shall be used for signaling of segment durations and the following  
17 restrictions shall apply:
- 18 • The timing of the segments in the MPD shall be accurate.  
19 • The Segment Timeline may be open ended @r (-1) or may closed @r (>=0).  
20 • The Segment Timeline may contain Segment Sequences as defined in  
21 5.3.9.6.4 and Hierarchical Templating as defined in 5.3.9.6.5.
- 22
- 23
- 24 — The Segment Timeline may be on Representation level to allow different segment  
25 durations in different Representations. However, it may be defaulted on Adaptation  
26 Set level.
- 27 8.11.2.5 Constraints on SegmentTemplate elements
- 28 — @initialization attribute may include data URLs as defined in RFC 2397.
- 29
- 30 8.11.3 Segment format constraints
- 31 Representations and Segments complying with this profile shall meet the following con-  
32 straints:
- 33 — Representations shall comply with the formats defined in section 7.3.5.

- 
- 1 — If Segment Sequences as defined in 5.3.9.6.4 and Hierarchical Templating as defined  
2 in 5.3.9.6.5 are used, then the first Segment of a Segment Sequence shall not carry  
3 'dums' brand in the Segment Type box ('styp') as major brand and all other Seg-  
4 ments of the Segment Sequence shall carry 'dums' brand in the Segment Type box  
5 ('styp') as major brand.

#### 6 8.11.4 MPD Updates and Inband Event Streams

7 In order for a DASH client to operate without frequent MPD requests and use the infor-  
8 mation contained in Inband Event Streams, the content authoring needs to obey certain  
9 rules.

10 In case of **MPD@type="dynamic"** and the MPD indicates that one or several Represent-  
11 tion(s) contain an inband event stream in order to signal MPD validity expirations, then  
12 the following applies:

- 13 — The **MPD@publishTime** shall be present.
- 14 — The **MPD@minimumUpdatePeriod** should be set to a small number, preferably 0.
- 15 — for each newly published MPD, that includes changes that are not restricted to any of  
16 the following (e.g. a new Period):
- 17 — The value of the **MPD@minimumUpdatePeriod** is changed,
- 18 — The value of a **SegmentTimeline.S@r** has changed,
- 19 — A new **SegmentTimeline.S** element is added.
- 20 — Any information that has been fallen outside the timeshift buffer. .

21 the following shall be done

- 22 — a new MPD shall be published with a new publish time **MPD@publishTime**
- 23 — an 'emsg' box shall be added to each segment of each Representation that contains an **In-**  
24 **bandEventStream** element with
- 25 — `scheme_id_uri = "urn:mpeg:dash:event:2012"`
- 26 — `@value` either set to 1 or set to 3
- 27 — the value of the **MPD@publishTime** of the previous MPD as the `message_data`

# Annex C Preselections for Audio from ISO/IEC 23009-1:2014/Amd.4

---

Note: This will be removed once ISO/IEC 23009-1:2017 [2] is available. The section numbers replicate the numbers in ISO/IEC 23009-1.

## 5.3.11 Preselection

### 5.3.11.1 Overview

The concept of Preselection is primarily motivated for the purpose of Next Generation Audio (NGA) codecs in order to signal suitable combinations of audio elements that are offered in different Adaptation Sets. However, the Preselection concept is introduced in a generic manner such that it can be extended and be used also for other media types and codecs.

Each Preselection is associated to a bundle. A bundle is a set of media components which may be consumed jointly by a single decoder instance. Elements are addressable and separable components of a bundle and may be selected or deselected dynamically by the application, either directly or indirectly by the use of Preselections. Media components are mapped to Adaptation Sets by either a one-to-one mapping or by the inclusion of multiple media components in a single Adaptation Sets. Furthermore, Representations in one Adaptation Set may contain multiple media components that are multiplexed on elementary stream level or on file container level. In the multiplexing case each media component is mapped to a Media Content component as defined in 5.3.4. Each media component in the bundle is therefore identified and referenced by the @id of a Media Content component, or, if only a single media component is contained in the Adaptation Set, by the @id of an Adaptation Set.

Each bundle includes a main media component that contains the decoder specific information and bootstraps the decoder. The Adaptation Set that contains the main media component is referred to as main Adaptation Set. The main media component shall always be included in any Preselection that is associated to a bundle. In addition, each bundle may include one or multiple partial Adaptation Sets. Partial Adaptation Sets may only be processed in combination with the main Adaptation Set.

A Preselection defines a subset of media component in a bundle that are expected to be consumed jointly. A Preselection is identified by a unique tag towards the decoder. Multiple Preselection instances can refer to the same set of streams in a bundle. Only media components of the same bundle can contribute to the decoding and rendering of a Preselection.

In the case of next generation audio, a Preselection is a personalization option that is associated with one or more audio components from one plus additional parameters like gain, spatial location to produce a complete audio experience. A Preselection can be considered the NGA-equivalent of alternative audio tracks containing complete mixes using traditional audio codecs.

---

1 A bundle, Preselection, main media component, main Adaptation Set and partial Adapta-  
2 tion Sets may be defined by one of the two means:

3 — A preselection descriptor is defined in 5.3.11.2. Such a descriptor enables simple set-  
4 ups and backward compatibility, but may not be suitable for advanced use cases.

5 — A preselection element as defined in 5.3.11.3 and 5.3.11.4. The semantics of the  
6 Preselection element is provided in Table 17c in 5.3.11.3, the XML syntax is provided  
7 in 5.3.11.4.

8 The instantiation of the introduced concepts using both methods is provided in the follow-  
9 ing.

10 In both cases, if the Adaptation Set is not including the main Adaptation Set, then the  
11 Essential descriptor shall be used together with the @schemeIdURI as defined in  
12 5.3.11.2.

### 13 5.3.11.2 Preselection Descriptor

14 A scheme is defined to be used with an Essential Descriptor as “urn:mpeg:dash:pre-  
15 selection:2016”. The value of the Descriptor provides two fields, separated by a  
16 comma

17  
18 — the tag of the Preselection

19 — the id of the contained content components of this Preselection list as white space  
20 separated list in processing order. The first id defines the main media component.

21 If the Adaptation Set contains the main media component, then the Supplemental de-  
22 scriptor may be used to describe contained Preselections in the Adaptation Set.

23 If the Adaptation Set does not contain the main media component then the Essential De-  
24 scriptor shall be used.

25 The bundle is inherently defined by all media components that are included in all Prese-  
26 lections that include the same main media component. Preselections are defined by the  
27 metadata that is assigned to each of the media components that are included in the Pre-  
28 selection. Note that this signalling may be simple for basic use cases, but is expected to  
29 not provide a full coverage for all use cases. Therefore, the Preselection element is intro-  
30 duced in 5.3.11.3 to cover more advanced use cases.

### 31 5.3.11.3 Semantics of Preselection element

32 As an alternative to the Preselection descriptor, Preselections may also be defined  
33 through the Preselection element as provided in Table 17d. The selection of Preselections  
34 is based on the contained attributes and elements in the Preselection element.

1

Table 17d — Semantics of PreSelection element

Element or Attribute Name	Use	Description
<b>Preselection</b>		
@id	OD default=1	specifies the id of the Preselection. This shall be unique within one Period.
@preselectionComponents	M	specifies the ids of the contained Adaptation Sets or Content Components that belong to this Preselection as white space separated list in processing order. The first tag defines the main media component.
@lang	O	same semantics as in Table 5 for @lang attribute
<b>Accessibility</b>	0 ... N	specifies information about accessibility scheme For more details, refer to 5.8.1 and 5.8.4.3.
<b>Role</b>	0 ... N	specifies information on role annotation scheme For more details, refer to 5.8.1 and 5.8.4.2.
<b>Rating</b>	0 ... N	specifies information on rating scheme. For more details, refer to 5.8.1 and 5.8.4.4.
<b>Viewpoint</b>	0 ... N	specifies information on viewpoint annotation scheme. For more details, refer to 5.8.1 and 5.8.4.5.
<i>CommonAttributesElements</i>	-	specifies the common attributes and elements (attributes and elements from base type <b>RepresentationBaseType</b> ). For details see 5.3.7.
<b>Legend:</b> For attributes: M=Mandatory, O=Optional, OD=Optional with Default Value, CM=Conditionally Mandatory. For elements: <minOccurs>..<maxOccurs> (N=unbounded) Elements are <b>bold</b> ; attributes are non-bold and preceded with an @.		

2

## 3 5.3.11.4 XML Syntax for Preselection element

```

<!-- Preselection -->
<xs:complexType name="PreselectionType">
  <xs:complexContent>
    <xs:extension base="RepresentationBaseType">
      <xs:sequence>
        <xs:element name="Language" type="xs:language" minOccurs="0" maxOccurs="unbounded"/>
      </xs:sequence>
      <xs:attribute name="id" type="StringNoWhitespaceType" use="required"/>
      <xs:attribute name="preselectionComponents" type="StringVectorType" use="required"/>
    </xs:extension>
  </xs:complexContent>
</xs:complexType>

```

4

## 5 5.8.5.11 Audio Interactivity Descriptor

6 A scheme is defined to be used with an Essential Property or Supplemental Property De-  
7 scriptor as "urn:mpeg:dash:audio-interactivity:2016".

---

1 This descriptor indicates if the associated audio content (Adaptation Set, Preselection or  
2 Representation) contains media components that are enabled for user interactivity  
3 through associated metadata. The descriptor is used e.g. to facilitate user interface (UI)  
4 resource management in the receiving client. Interactivity involves user interaction with  
5 elements, i.e. the user can modify dynamically for example the gain, spatial position or  
6 mute/unmute status of audio elements. Therefore, a UI is required to enable this kind of  
7 personalization during playback. A supplemental descriptor should be used if a UI is not  
8 mandatory to select and play the corresponding audio elements. An essential descriptor  
9 should be used if a UI is mandatory in order to play the corresponding audio elements.  
10 The `@value` attribute is owned by the codec in use. The detailed semantics of the de-  
11 scriptor are also owned by the codec in use.
